The Washington Electric company announces that it is doing a good business in its new quarters at 207 South Canal street, Chicago. It will be remembered that the Washington Electric company was the concern organized by Louis Stein and W. O. Meissner about a year ago to manufacture the Meissner focusing lamp and the Washington alternating incandescent arc lamp now so well known to the trade, beside a number of other valuable specialties. The company, however, was recently reorganized, Mr. Stein disposing of his interest and Merrill Watson joining hands with Mr. Meissner to carry on the business. Under the present organization Mr. Meissner holds the office of president and Mr. Watson is the secretary of the company. The Washington Electric company not only does a manufacturing business, but also pays attention to high class repairing in the line of instrument work, etc. Its prospects are bright.

Charles G. Armstrong, Auditorium tower, Chicago, electrical engineer and architect, has prepared the specifications and supervised the installation of a large number of electrical plants in and about Chicago during the last year. Among some of these may be mentioned the plants in the Renfost building, Kenwood apartment house, Heisler & Young bakery, Lakota Hotel, University of Chicago, Illinois Central depot, Ellsworth building, Meyer building, Auditorium Annex, Butterfield building, Athletic Association building, Newberry Library, Produce Cold Storage Exchange and the Huck & Young, Hartford, Teutonic, Schiller and Stock Exchange buildings, as well as the Academy of Sciences and the plant of the South Park commissioners. These plants are all of 1,000 or more lights capacity. Outside of Chicago some of the more important plants for which Mr. Armstrong drew specifications are those in Monticello, Carthage, Maroa, Decatur and Sandwich, Ill.; that of the Columbia building, Louisville, Ky., of the Wainwright, St. Nicholas and Union Trust buildings in St. Louis, the power transmission plant of Whitman & Barnes, West Pullman, and a great many others.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued June 12, 1894

521,103. Contact Trolley. Robert W. Hawkesworth, East Orange, N. J.

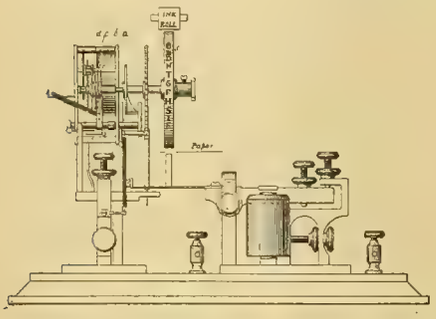
The device patented is intended to do away with the necessity of breaking contact between the trolley and trolley wire in an overhead system of electric traction when the end of a route is reached, or for some reason it is desired to change the direction of the motion of the car. It consists of constructing the trolley bar with two arms, connected by a spring in such a manner that when one arm is pulled down and secured by the operating cord the other will be held up against the trolley wire with a spring contact, and will yield to any inequalities without losing its contact with the wire, or without danger of breaking the bar in case any fixed object should be struck.

521,168. Thermo-electric Battery. Ernst W. Jungner, Skara, Sweden.

This thermo-electric chain battery is more particularly adapted for use with electric fire alarms, but it may be used for other purposes. The construction of the battery comprises a series of elements held together, and each composed of two strips, preferably wires of different metals. The alternate joints are suitably insulated by means of a non-conductor of heat. The length and diameter of the metal strips may be greatly varied, according to the uses to be made of the chain. The inventor has found that, when the thermo-electric chain battery is to be used in connection with electric fire alarms, excellent results are obtained by using copper and iron wire of a diameter of about 1 to 1.5 millimeters, and of a length of about 40 to 50 millimeters, forming elements of from 70 to 80 millimeters, or from 15 to 20 elements to the running meter of chain.

521,170. Printing Telegraph. Oscar L. Kleber, Pittsburg, Pa.

The invention consists of a systematized class arrangement and grouping of telegraphic signals with corresponding class groups of alphabetical letters, numeral characters, punctuation marks, etc., in combination with an organized mechanism by which transmitted telegraphic signals of Morse's system are caused to produce and print such matter as is sent over a telegraph line. The accompanying drawing represents a front elevation of the inventor's mechanism. The letters and numerals on the type wheel 5 are relatively so arranged as to correspond with certain points or positions on the selecting disks *a*, *b*, *c*, *d*, and respond to Morse signals made upon them, so that the letter or numeral corresponding to its Morse signal must move and coincide in point of time, and therefore take a predetermined position.



NO. 521,170.

521,183. Police Signal Telegraph System. Charles A. Rolfe, Chicago, Ill.

The primary object of the inventor is to secure the sending of an alarm of fire, no matter how careless, ignorant or hasty the person opening the signal box may be.

521,188. Magneto Telephone. Alfred Stromberg and Andrew Carlson, Chicago, Ill.

The invention consists in a cheapened method of constructing a telephone, for which a patent has been issued, comprising a magneto generator provided with soft iron polar projections, around which the telephone coils are wound, and opposite the ends of which the diaphragm is located. It is proposed to construct the magneto generator of parallel disposed bar magnets, and providing between the magnets at one end pole pieces, between which the armature is adapted to rotate.

521,220. Electric Telephone. Wilton L. Richards, Malden, Mass.

The idea of the invention is to produce a telephone which, while being sensitive to sounds originating at some distance from the instrument, shall at the same time remain uninjured by powerful tones originating close at hand. The current changing material—finely divided carbon *M*—is placed within the chamber *C* in the sectional drawing. In order that the pressure of the air may be equal on both sides of the front electrode, the inventor forms the flexible disk *g* of extremely fine wire gauze, and between its surface and the surface of the slate casing to which it is secured a very thin washer of porous paper is interposed, which serves as a cushion without materially hindering the sufficient passage of air. The gauze disk *g* supports the front electrode, and completely closes the front of the chamber, retaining the granular conducting material in the chamber between the electrodes. The instrument when in use may be suspended by a light stirrup *s* from cords. The compound button *B* has its front electrode rigidly attached by means of nuts to the wooden diaphragm, while the back electrode rests in its support on the frame, and is comparatively loose. The results of the operation of the instrument are therefore largely due to the inertia of the slate casing, and probably to a considerable extent also to the simple agitation of the granular carbon contained in the button.

521,238. Bond for Electrical Conductors. John Herr, Philadelphia, Pa.

The bond consists of a split tapered bolt which is furnished with a hole passing longitudinally through its center, and the exterior end of the shank of which is threaded, and which is furnished with a head adapted to be grasped by a wrench or spanner, and of a nut adapted to be screwed up on the tapered shank of the bolt in order to close it down upon the wire and to hold it in place upon the rail.

521,239. Burglar Alarm. Clement R. Hoopes, Ogontz, Pa.

The object of the invention is to provide an attachment to chain bolts upon doors, so that an alarm is sounded upon any attempt being made to manipulate the bolt. Contact points upon the bolt, an electric circuit and an annunciator are employed.

521,260. Electric Battery. Fred Dubero and Peter Mohrdieck, San Francisco, Cal.

The object of this invention is to provide a continuous or constant battery, the elements of which are renewed during the operation of the battery, and in the employment in conjunction with the battery of sea water as the active energizing element. In its construction any suitable or desirable substance is employed, which will form the positive and negative elements of the battery. These elements are so arranged with relation to each other that the negative element may be alternately submerged in the active solution in which the positive element remains submerged, and then withdrawn and exposed to the air to become dry and to absorb a certain portion of air before it is again submerged. A very suitable method is to make the negative element in the form of a rotary hollow cylinder.

521,269. Core Attracting Solenoid. Wenzel R. Michl, Wetter-on-the-Ruhr, Germany.

The invention relates to the combination of a solenoid and of a movable iron core designed to be attracted by and drawn into the solenoid, and the object of the improvement is to render the action of the solenoid on the core uniform throughout the course of the latter. If the coils of wire constituting a solenoid are arranged uniformly in all portions of it, and if the transverse sections of the core are all alike, the core, when introduced with one end into the solenoid energized by an electric current, will be drawn in with a force which increases until the end of the core has arrived at or near the center of the solenoid; thereupon the attracting force will remain constant for a short distance, and finally it will decrease again. In order to render the force uniform, the inventor winds the coils of the solenoid in such manner that the number contained in consecutive sectional portions of the same length decreases from the core introduction end to the middle of the solenoid, and then increases again.

521,274. Telephone Switch. Joseph B. Smith, Manchester, N. H.

The device patented is a positive one, and is independent of springs, weights or the gravity of the telephones, and is simple and effective. The invention comprises an improvement in switches for telephones, and has for its object the putting of a telephone positively into or out of the line circuit by removing the telephone from or replacing it on its support on the call box of the instrument.

521,303. Busy Test for Multiple Switchboards. James A. Wotton, Atlanta, Ga.

This device is for use in making busy tests on a multiple switchboard in exchanges in cities where there is considerable induction from exterior electric conductors, such as, for example, electric street railways, in which the ground return circuits interfere with conduit telephone systems.

521,311. Trolley Wire Finder. Theophilus E. Gressle, Indianapolis, Ind.

The invention is designed to guide the conducting wire to the groove of the trolley after the latter has been shifted, by which rapidity and ease in again causing contact to be made between the trolley and conducting wire are accomplished. The invention is also designed to admit of the required reversibility of the trolley support necessary in changing the direction of the car, and to effect the automatic readjustment of the parts to normal position.

521,322. Incandescent Lamp Socket. Luke R. Peck, St. Johns, Mich.

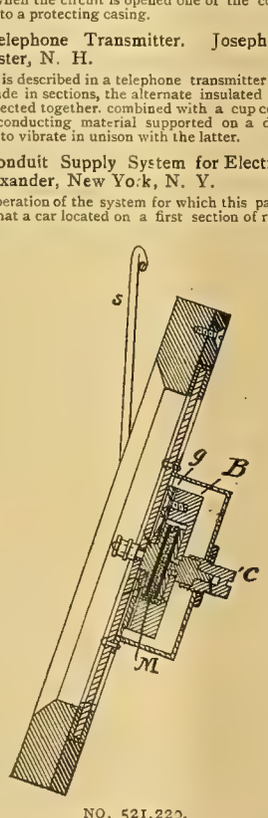
The invention consists in the construction of a lamp socket made in detachable sections, to the upper section of which the terminals of the conductors are secured with suitable contacts, and the lower section detachably engaging with them. It further consists in the construction of the frame comprising on the detachable section suitable fusible strips, and in the peculiar construction and arrangement of the lamp contacts and switch, so that when the circuit is opened one of the contacts is withdrawn into a protecting casing.

521,325. Telephone Transmitter. Joseph B. Smith, Manchester, N. H.

There is described in a telephone transmitter a multiple electrode made in sections, the alternate insulated layers of which are connected together, combined with a cup containing finely divided conducting material supported on a diaphragm, and adapted to vibrate in unison with the latter.

521,326. Conduit Supply System for Electric Railways. Harry Alexander, New York, N. Y.

The operation of the system for which this patent was issued is such that a car located on a first section of road will receive current directly from the first section of a working conductor through a collector resting on the conductor, and through insulated conductors which pass up to the car. When the car reaches the end of the first section of the working conductor a supplementary contact device, which is electrically connected with the collector, makes contact with a supplementary contact conductor, thereby diverting current from the working conductor through a switch magnet to the rail, operating the switch and connecting the supply conductor to the second section of the working conductor. When the car reaches the second contact conductor the second switch is operated, connecting the continuous supply conductor to the third section of the working conductor, and when the car reaches the contact conductor current is diverted through the magnet of the first switch, thereby breaking the connection between the supply conductor and the working conductor at that switch, and so on throughout the length of the line.

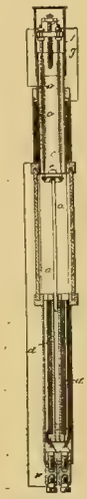


NO. 521,220.

521,362. Electric Arc Light for Magic Lanterns. Charles Beseler, Jersey City, N. J.

The invention, which is mostly applicable to details, provides a new and improved arc light for magic lanterns, which will be simple and durable in construction, and arranged in such a manner as to enable the operator to conveniently and accurately adjust the light relative to the condenser of the magic lantern in order to produce the best results upon the screen.

521,394. Apparatus for Measuring and Recording Electric Currents. William Thomson, Glasgow, Scotland.



As a simple instrument for measuring electric currents the invention uses a permanent or electro-magnet attracted by a fixed solenoid *d*, and carrying a pointer which moves past a graduated plate or scale, and this magnet is suspended in the proper relation to the fixed solenoid by two fine oppositely coiled spiral springs *c c*, which, in the use of an electro-magnet, form the conductors for its helix. The current to be measured passes through the fixed solenoid, attracting inward the movable magnet *a a* with a force which is very nearly the same at all times for the same strength of current through the fixed solenoid, and very nearly proportionate to the strength of this current through a wide range of motion of the movable magnet within the fixed solenoid, provided that the electro-magnet is kept magnetized nearly to saturation. Thus the strength of the current through the fixed solenoid may be very approximately read off on the straight scale of equal divisions, indicating the distance through which the movable electro-magnet is pulled against the force of its bearing springs when it is hung as described. To measure the total quantity of electricity, with this simple instrument is combined a counter or recorder, which is actuated at periodic intervals of time by a constantly revolving cam, through the medium of a projection carried on, and thereby controlled in its position by the electro-magnet, which is in turn determined in its position by the strength of current passing, and the relation of the parts is such that the extent of movement of the recorder at each impulse varies according to the extent of previous depression of the magnet with its projection; or, in other words, depends on the strength of the current passing.

NO. 521,394.

521,396. Electric Clock Winding Mechanism. Adolph E. Vidal and Gaston Hervieu, London, England.

The invention relates to electrical winding mechanism for clock movements, and its object is to wind up automatically the spring or weight at intervals to the same extent as either have become unwound during a short time of working.

521,412. Track Circuit. Louis F. Johnson, Poughkeepsie, N. Y.

This invention relates to electric signaling systems for railways of that general class in which a circuit is completed from one line of rails of a section to the other line of rails through the wheels and axles of the car which may happen to be on such a section, and provides means for obviating the difficulties found to be inherent in such systems resulting from destroyed insulation or short-circuits in damp weather.

521,422. Telephone Call Recorder. William F. Smith, San Francisco, Cal.

This invention has for its object to transmit telegraphically from a subscriber's station to the operator at a switching station the number of another subscriber's station with which connection is desired, and it is designed to take the place of the present mode of transmitting these numbers orally. The invention consists of a printing mechanism at the switching station, constructed and arranged to print or mark in suitable characters upon a tape or paper strip the figures or characters composing the "call," and mechanism located at the subscriber's telephone to actuate the printing mechanism telegraphically.

521,423. Automatic Electro-magnetic Cut-out. Lucius T. Stanley, Brooklyn, N. Y.

The invention comprises in an electro-magnetic cut-out the combination of a vertically movable magnetic plunger having a pole plate at its lower and a non-magnetic extension at its upper end, a coil surrounding the plunger, a magnetic casing surrounding the coil, and a pivoted switch lever in position to be encountered and raised by the non-magnetic extension of the core on its upward movement.

521,434. Duplex Electric Arc Lamp. George F. Edens and John B. Brewer, Xenia, O.

The invention relates to trip mechansim for duplex arc lamps, and its objects are to provide means by which either set of carbons may be consumed first instead of being confined to one particular set; and also to so arrange the parts that the feed rod of either set of carbons will automatically complete the arc in the adjacent set during its downward movement. A further object is to provide means for controlling the trip mechanism from without the casing. The purpose is to provide a trip lever for each feed rod, this lever engaging with one of its ends a portion of the feed rod, and having its opposite end arranged in the path of movement of the adjacent feed rod; also in providing each lever with means arranged without the casing for controlling the movement of the levers. The invention further consists in certain features of construction and combinations of parts.

521,435. Automatic Electric Signal Lamp. John R. Farmer, St. Louis, Mo.

This invention consists in a hood which is to be suspended in an electric overhead trolley system over the trolleys where two or more trolley lines cross each other, and it is so arranged that suspended from the hood there is an ordinary signal lantern having four lights, the alternate ones being white and red as is usual in junction lamps. The operation of the signal consists in turning the lamp one-eighth of a revolution in either direction, according to the direction of the approaching car. This is accomplished by an electric connection which is formed by the trolley of the electric car, which closes the circuit through the magnet in the hood and turns the lamp one-eighth of a revolution, turning the white light in a direction parallel to the movement of the car, and the red light facing the direction of the cross lines.

521,436. System of Electrical Distribution. Thomas J. Fay, New York, N. Y.

The inventor claims in a multiple series system of distribution the combination of a main generating station, two main conductors leading from it, an intermediate or compensating conductor between the groups or sets of translating devices, two generators connected in series with each other and normally tending to augment the supply of current to the mains, but so connected as to supply extra current to either group of translating devices, which requires it in order to establish a balance between the two groups, and an electric motor driving both generators and supplied with current from the mains.

Western Electrician.

Vol. XIV. CHICAGO, JUNE 30, 1894. No. 26

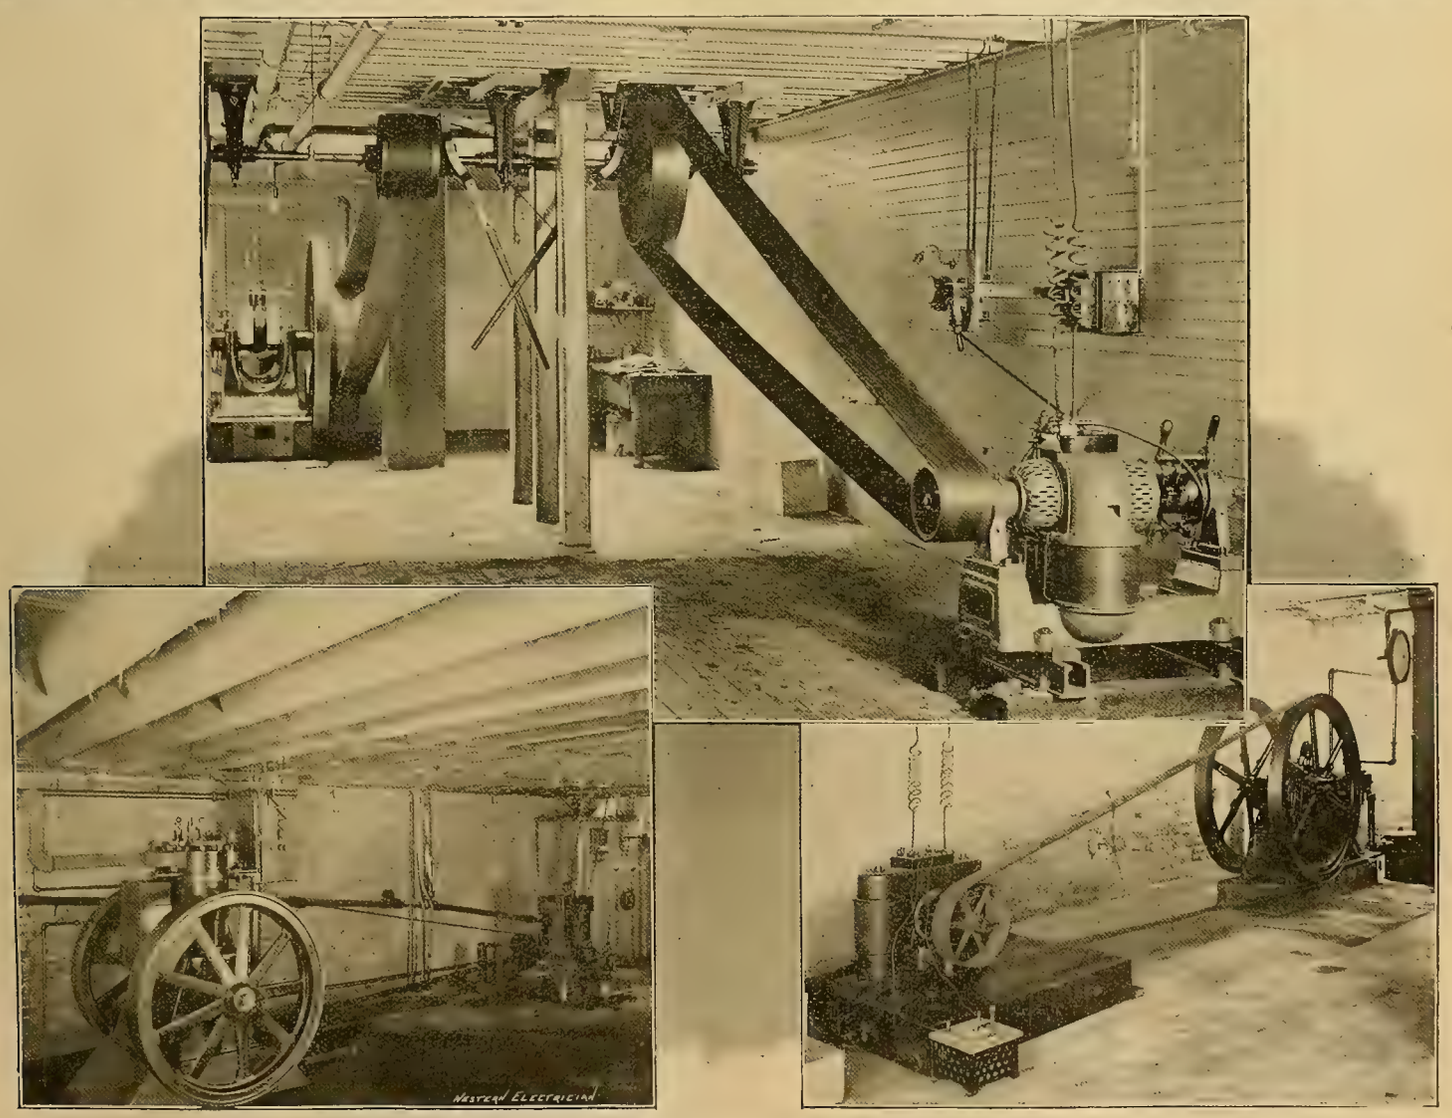
Some Electric Plants in Chicago Driven by Gas Engines.

The demand for isolated electric light installations has opened a field for a cheaper and more convenient primary source of energy than found in the consumption of coal to supply the steam engine. In the smaller plants isolated from a central station supply and without steam and boiler facilities the gas engine has for some time been attracting attention and giving favorable results. The advantages claimed for it over steam engines fired with either coal oil, wood or coal are now being thoroughly investigated in this country. It is pointed out that no tedious preparation is required before starting; there is no chimney to build, and no smoke nuisance, no coal to lay in or ashes to cart away, no dust and no boiler, no safety-valves and water-gauges to watch, no fires to slack or bank at stopping time, no regular attendance required beyond oiling, cleaning and starting; and, beside all these advantages it is claimed that there is great economy as compared with steam engines or any power of equal size.

Without entering into the comparative merits of the several types of gas engines which are upon the market in the United States, it is the intention in this article to illustrate different types of gas engines installed in Chicago for the purpose of running electrical machinery. The work of these plants will give some idea of the flexibility of the gas engine and of the varied applications to which it may be applied.

In Fig. 2 upon this page is presented a general view of the power plant of the Wakefield Rattan company, 220 Wabash avenue. Here is installed a gas engine of the White & Middleton type, of 25 horse power capacity, driving by means of main line shafting and counter shafting a dynamo for lighting the premises and a five horse power Reedy elevator, beside pumping air which is used in starting the engine. An engine of this type and size weighs about 6,000 pounds, and has a length of 10 feet. The Siemens & Halske dynamo shown in the foreground gives 90 amperes at 1,190 revolutions, and is at present running 12 Siemens & Halske arc lights and between 40 and 50 incandescent lamps of the same make. In spite of the change in load upon the engine when the elevator is in service, the lights burn without apparent unsteadiness, and the voltmeter seldom varies to a greater extent than two volts. The instrument is a magnetic vane voltmeter of Queen & Co.'s manufacture. The engine is belted to an 18 inch pulley on the shaft and the dynamo to a 36 inch pulley. The elevator driving machinery, not shown in the picture, is upon the main line shaft and consists of worm gearing and sheave apparatus. Natural gas is piped direct to the engine from the mains in the streets. It may be said of the White & Middleton engines that they will run, without any alteration, on either natural or artificial gas. They are also superior in economy and efficiency as gasoline engines. They are made from 3½ to 55 horse power, and have no valves to grind in with emery or slide valves which require scraping and cleaning. The igniter is a very simple and durable device, with no springs or mechanism of any kind to control it. The governor is also a simple and substantial device attached directly to the crank shaft; it insures regular speed under varying loads, and controls the quantity of gas for amount of work done. There is no other mechanism attached to the crank shaft to control the movements of the engine except the governor, which makes the engine extremely simple. The engine is furnished with automatic oilers on all working parts, and requires about the same grade of lubricating oil as an ordinary steam engine. It is not slighted in any manner in the way of construction, crank shafts, connecting rods and other working parts being made of the very best open-hearth forged steel and having heavy bronze metal bearings. The iron castings are made from the very best charcoal iron which can be secured.

No less interesting in its operation is the plant in the basement of the clothing establishment of Mickel & Pitzele, 767 South Halsted street, for here a Raymond gas engine is driving an Edison 12 kilowatt dynamo belted direct without the intervention of shafting. It is of about 15 horse power capacity and at the present time the dynamo is supplying a large number of incandescent lamps as well as



FIGS. 1, 2 AND 3. SOME ELECTRIC PLANTS IN CHICAGO DRIVEN BY GAS ENGINES.

a number of arc lights. As seen in Fig. 1 the engine is of the vertical type, and is intended for high speed work. One of the advantages claimed for this engine is its electric ignition, which is operated by primary batteries and insures regular ignition and avoids objectionable smell and waste of gas. The plant requires a minimum of attention, and is making a record for electrical efficiency. A switchboard furnished with Weston current indicating instruments is shown back of the dynamo.

Another application of a gas engine directly belted to

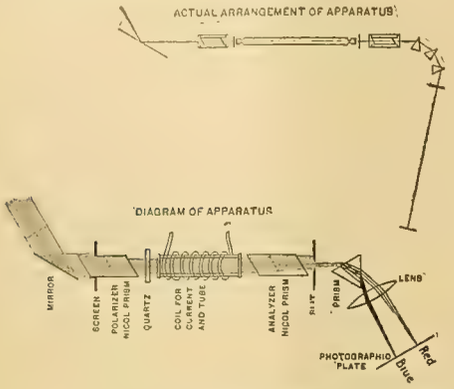


FIG. 1. A RELIABLE METHOD OF RECORDING VARIABLE CURRENT CURVES.

a dynamo is illustrated in Fig. 3. In this plant, which is located in the basement of 245 Lake street, a seven horse power Otto engine drives a Rockford dynamo, which, at the present time, is supplying about seventy 16 candle power incandescent lights. This engine has most of its working parts upon the outside, readily accessible, and is provided with a reliable electric and practical magnetic igniter. It is of the type 4b and utilizes the four stroke cycle. The engine is supplied with natural gas from the streets, and is a fine illustration of the convenience and practicability of such an installation. In design the engine is small and pleasing in appearance, and the whole plant may be placed in a remarkably small space.

These installations have been taken as examples of the usefulness and evident economy of gas engines in comparatively small plants, but many examples may be had of much larger engines being used for electric lighting. Waukesha, Wis., has a 100 horse power gas engine to operate its system, and Racine, Wis., possesses two 50 horse power engines for the same purpose. In Milwaukee there are a number of Otto engines driving electrical machinery, and there is no reason for doubting that with increased efficiency and continued development they will increase rapidly in Chicago business establishments. Several gas engine installations in Chicago have already been described and illustrated in the columns of the journal.

Electric Coal Mining in Kansas.

An electric coal mining plant has been established at Boicourt, Kas., in the colliery of the Bradley-Vernon Coal

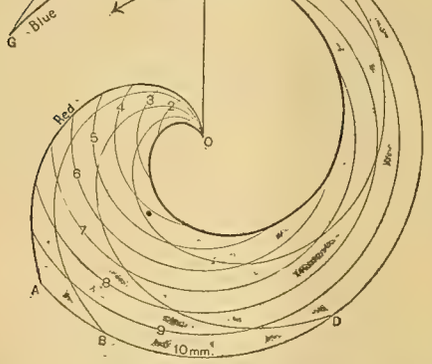

FIG. 2 A RELIABLE METHOD OF RECORDING VARIABLE CURRENT CURVES.

company. Two electrically operated coal cutters are at present employed, each machine having a capacity to undercut 30 inches of coal 400 lineal feet in a day. Current is supplied to the motors on the coal cutters by an 85 horse power 220 volt generator, which is of sufficient capacity to operate four cutting machines of the size in use. The plant has thus far given very satisfactory service. The electrical machinery is of the standard type of mining equipment made by the General Electric company, the sale having been made by the Chicago office of that company.

A Reliable Method of Recording Variable Current Curves.[1]

By Dr. Albert C. Crehore.

INTRODUCTION.

A practical problem that has in more recent years presented itself to the electrician and physicist alike is "How shall we measure the exact current which flows in a conductor at any instant of time and record all the irregular changes to which it is subject?" Probably everyone who has thought of such matters at all has considered this problem in some of the phases which it presents. The importance of the question since the introduction and extensive use of the alternating current has emphasized the fact that we need a "reliable method" of measuring the instantaneous values of a variable current, which is not a "method by points," but "a method which continuously records the current."

Under "a method by points" is included any method in which the current is obtained from readings (usually of an electrostatic voltmeter) due to the charge of a condenser which may be connected in at any point of time. The essential characteristic of the method is that the current is supposed to repeat itself exactly during successive periods, or more generally when the conditions are exactly repeated. There can be no doubt that the current does repeat itself under exactly similar conditions, but can we be sure that those conditions are exactly repeated? By this method a number of points are found, the time occupied being at least several minutes, and the collection of points properly arranged is a representation of the current during as short a time as the one-hundredth of a second, perhaps. Yet this method has proved to be a very useful and practical one, and has given us information concerning the currents and potentials of generators and transformers which is of paramount importance. Yet all will agree that this "method by points" is too limited in its application, and does not show us any sudden temporary

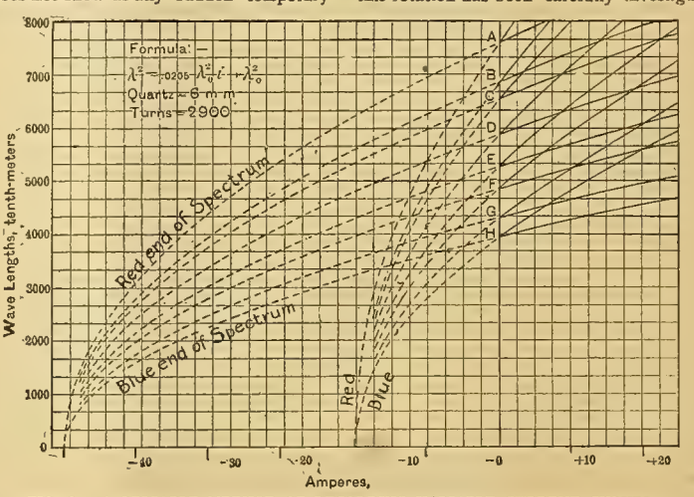

FIG. 3. A RELIABLE METHOD OF RECORDING VARIABLE CURRENT CURVES.

change taking place in a current, which does not repeat itself. Such, for instance, as a sudden "make" or "break," or "change" in an alternating current, would not be easily shown by this method. The second method, previously designated "a method which continuously records the current," is the one to which this paper more particularly refers. Under this head is included all methods which attempt to record the current by causing it, either directly or indirectly, to move a material something so that its displacement is some single valued function of the current. As an example of this method may be mentioned the well-known experiments of Froelich, in which a telephone is used, upon the disk of which is mounted a mirror that permits a beam of light to be reflected from it. Any vibration of the disk gives an angular motion to the ray of light, and this motion is in turn recorded upon a moving photographic plate. Other examples might be mentioned in illustration of this method; for instance, a wire which is deflected in a magnetic field, or stream of mercury so influenced; but it will be noticed that in all of these cases an appreciable amount of ponderable matter is required to be moved backward and forward during each reversal of the current. When the current reverses hundreds of times per second, the unavoidable difficulty is introduced that the forced oscillations of this ponderable matter, no matter how small in amount, become so superimposed upon those of the current which it is desired to measure that they are inseparably mixed together, and the record does not show the true current, but the resultant vibrations of the instrument. That this is the case with the method of the telephone, above referred to, has been established beyond a doubt, it seems, by experiments conducted at Cornell University by Henry Floy. The current furnished to the telephone was carefully measured by the "method by points," and care was taken to see that the current as measured by points was the same as that used in the telephone. The vibrations of the telephone did not even approximately agree with the current as measured by well-established methods.

Bearing these points in mind, and remembering the high frequency of some of the oscillations which it is desired to record, may we not with some degree of certainty predict that any of these methods requiring the rapid motion of ponderable matter will be open to precisely the same objections which are noticed in the case of the telephone? Without answering this question, probably all will agree that the difficulty may certainly be avoided by using as a vibrator, instead of this so called "ponderable matter," a vibrator that has no weight. It is to this question of finding a form of vibrator without weight that I invite your attention.

THE WEIGHTLESS VIBRATOR.

The idea of the weightless vibrator is perhaps already suggested in the beam of light. But how shall we cause a beam of light to have a change in direction simply by means of a current flowing in a circuit without the intervention of some moving material? A way of influencing a beam of light directly by an electric current (or more properly by its magnetic field) is that discovered long ago by Faraday. It is by means of the discovery of the rotation of the plane of polarization by an electric current that I propose a method of obtaining a weightless vibrator. The explanation will be made clearer by reference to the diagram of apparatus, Fig. 1. A beam of light is passed through a polarizer (Nicol prism) so that the vibrations of the beam take place in only one plane upon emergence. If it is then passed directly through an analyzer (Nicol prism) the latter may be set at such an angle as to prevent all light from passing through it, and thus produce darkness beyond the analyzer. Faraday's discovery was that, if a beam of polarized light is passed through some substance in the direction of the lines of magnetization within that substance, there is a rotation of the plane of polarization in a direction which is the same as the direction of the current required to produce such a magnetic field. The direction of rotation is unaltered, therefore, whether the light beam advances in the same or the opposite direction to the magnetization, so that a beam reflected back and forth through the substance several times has its rotation increased by equal amounts each time. If the direction of the ray of light be at right angles to the lines of magnetization there is no rotation produced. The amount of this rotation has been carefully investigated by Verdet, who announced laws by which it may be expressed. They are summed up in the following statement: "The rotation of the plane of polarization for monochromatic light is in any given substance proportional to the difference in magnetic potential between the points of entrance and emergence of the ray," That is, it is equal to a constant times this difference of potential and is expressed by the formula

$$\theta = v\,V. \qquad (1)$$

where θ=angle of rotation, V=difference in magnetic potential, and v for a given wave-length is constant in any one substance. This constant is known as Verdet's constant. If now the light is passed through polarizer and then through a tube containing the substance used, around which is wound a coil of wire, and thence through the analyzer, an observer would find complete darkness upon looking through the analyzer when set in the crossed position. But if without moving the analyzer a current is sent through the coil on the tube, light appears to the observer. This is because the plane of polarization has been rotated by the current and practically the prisms are no longer crossed. Now let the analyzer be rotated while the current is still flowing, and the observer will see a series of beautiful colors through the analyzer, a different one for each position of it; but, as long as the current flows, he cannot produce darkness again by any amount of rotation of the analyzer.

This effect suggests what is known to be a fact, that the different wave-lengths composing white light are rotated by the current in different amounts, so that when the analyzer is turned to the angle corresponding to the yellow light, say, only the yellow light is prevented from passing through the analyzer. All the other rays, being rotated by different amounts, pass through the analyzer, and there being mixed together they give rise to the series of beautiful complex colors above mentioned. A different color is seen for each position of the analyzer because in each position a different color is subtracted from white light, and the observer sees what is left or merely the complementary color.

The law which tells the amount of rotation given to the different colors is pretty accurately known; and theory in this case is in close accord with the observed facts. The equation which closely expresses the amount of the dispersion for the different wave-lengths may be written:

$$v = c\,\lambda^3/\lambda^2\left(1 - \frac{\lambda}{n}\frac{dn}{d\lambda}\right), \qquad (2)$$

where v is the so called Verdet's constant, λ the wave

1. Read before the American Institute of Electrical Engineers, Philadelphia, May 17, 1894.

length, and n the index of refraction of the medium; c is a constant for any one medium, which is, however, inversely proportional to the permeability of the medium. This is a formula at which Maxwell arrived from his theory of molecular vortices, and we shall see how closely it is in accord with observation. We see by this formula that Verdet's constant depends not only upon the wave length, but upon the index of refraction corresponding to that particular wave length, and also upon the rate of change of the index with respect to the wave length. If this rate of change of n with respect to λ is small, as would be the case with a substance where the dispersion is small and the index of refraction regarded as approximately constant, then it is seen that the formula reduces to an extremely simple form, viz.:

$$v = \frac{c^1}{\lambda^2} \qquad (3)$$

Here Verdet's constant is inversely proportional to the square of the wave length. Using this approximate form for the present, we see from Verdet's law, equation (1), that

$$\theta = vV = c_1 \frac{v}{\lambda^2} \qquad (4)$$

But the difference of magnetic potential, v, is $\frac{4\pi_1 \cdot Si}{10}$, where Si is ampere turns, and thus we have

$$\theta = 4\pi c_1 \cdot Si / 10\lambda^2 = c_2 i / \lambda^2. \qquad (5)$$

where

$$c_2 = 4\pi c_1 \cdot S / 10 \qquad (6)$$

A reference to Fig. 2 will show this relation between angle of rotation, wave length and current. Several spirals are shown corresponding to the several lines of the spectrum, known as *A*, *B*, *D*, *F*, and *G*. The radii of the circles which intersect these spirals are proportional to the current flowing in the circuit, while the angle, which the radius, drawn to any point of intersection, makes with *O P* represents the rotation for that particular wave length and current. The red and blue spirals indicate that the red rays are not rotated so much as the blue. The direction of rotation in the diagram is as indicated by the arrow. Now, returning to the observer looking through the analyzer, if he could resolve the light there seen into the pure colors of the spectrum, what he should expect would be, with no current, a complete spectrum, since all rays are rotated by the current. But let him rotate the analyzer, and he finds that first one color then another disappears, and a dark band is seen to move across the spectrum as he rotates the analyzer. Again, let him rotate the analyzer to a certain angle and leave it there while he varies the current. He should expect that the band would move, but would vanish entirely with zero current, and thus prevent observation for small currents.

Fortunately we have substances which naturally rotate a beam of polarized light, for by means of this aid we may obviate the difficulty that the band vanishes with no current. For instance, a parallel plate cut from a crystal of quartz perpendicular to the optic axis has this property of rotating the plane of polarization. Quartz is selected for the material used because of its great transparency and high specific rotary power. The law of the rotation is similar to that already mentioned for the rotation by the current. The approximate law is that the rotation is inversely as the square of the wave length, which may be expressed:

$$\phi = c_3 e^3/\lambda^2, \qquad (7)$$

where ϕ is the angle of rotation for the wave length λ, and e is the thickness of the plate. The thickness of the quartz plate is seen to correspond to the current in equation (5). Fig. 2 represents the actual rotation for different thicknesses of quartz, each circle corresponding to a plate one millimeter thick. The equivalent of a quartz plate one millimeter thick is represented by 35,700 ampere turns wound upon a tube containing carbon bisulphide. This latter is the substance used, being selected on account of its high transparency and specific rotation.

If a quartz plate be placed between polarizer and analyzer the effect is the same as if the current circulated around the tube of carbon bisulphide, and we may by rotating the analyzer move the dark band completely across the spectrum by means of the quartz plate without any current. But suppose we set the analyzer so that the dark band remains in the center of the spectrum, and then pass a current through the coil. We observe a motion of this dark band back and forth through the spectrum as the current is repeatedly reversed. For any given current its position is always the same, so that its motion may be calibrated by passing known currents through the coil. Have we not in this found a weightless vibrator that is sure to move in unison with the currents, if the term is allowed?

Before passing on to the more practical side of the question, it may be asked, will this band move back and forth so that its displacement is approximately proportional to the current? The answer to this question lies so near at hand that your attention is invited to it for a moment. The rotation of the plane by quartz is approximately represented by the formula:

$$\phi = c_3 \frac{e}{\lambda^2}.$$

The rotation by the current is represented by

$$\theta = c_2 \frac{i}{\lambda^2}.$$

If both these rotations take place together, the resultant is merely the sum of the components, and

$$\chi = \phi + \theta = (c_3 e + c_2 i) \frac{1}{\lambda^2}. \qquad (8)$$

The position of the dark band depends upon the position of the analyzer. Let the analyzer be set at some convenient angle, α, with the position of complete darkness, and let it remain there. Then the wave length or color where the dark band occurs for the quartz plate (being called λ_0) is given by (7) above, and we have

$$\alpha = c_3 \frac{e}{\lambda_0^2}. \qquad (9)$$

The wave length corresponding to this constant angle, α, when both quartz and current are used, is given by (8), and we have

$$\alpha = (c_3 e + c_2 i) \frac{1}{\lambda^2}, \qquad (10)$$

in which λ is that wave length corresponding to a certain

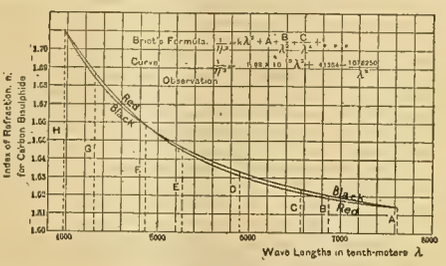

FIG. 4. A RELIABLE METHOD OF RECORDING VARIABLE CURRENT CURVES.

current, i, and therefore i and λ are co-ordinate variables. Equating the values of α, we have

$$\frac{c_3 e}{\lambda_0^2} = \frac{c_3 e + c_2 i}{\lambda^2}. \qquad (11)$$

This may be written

$$\lambda^2 = \frac{c_2 \lambda_0^2}{c_3 e} i + \lambda_0^2 \qquad (12)$$

and in this form the relation between wave length and current is seen to be represented by a parabola. In Fig. 3 are represented two sets of parabolas obtained from equation (12) by assuming that λ_0 and e take in succession different values. It will be remembered that λ_0 represents that wave length corresponding to the position of the dark band for no current. It is therefore the value of λ, when i is equal to zero, as appears from the equation independently. The axis of λ is the vertical line to the right of the figure, upon which the letters *A*, *B*, etc., are written.

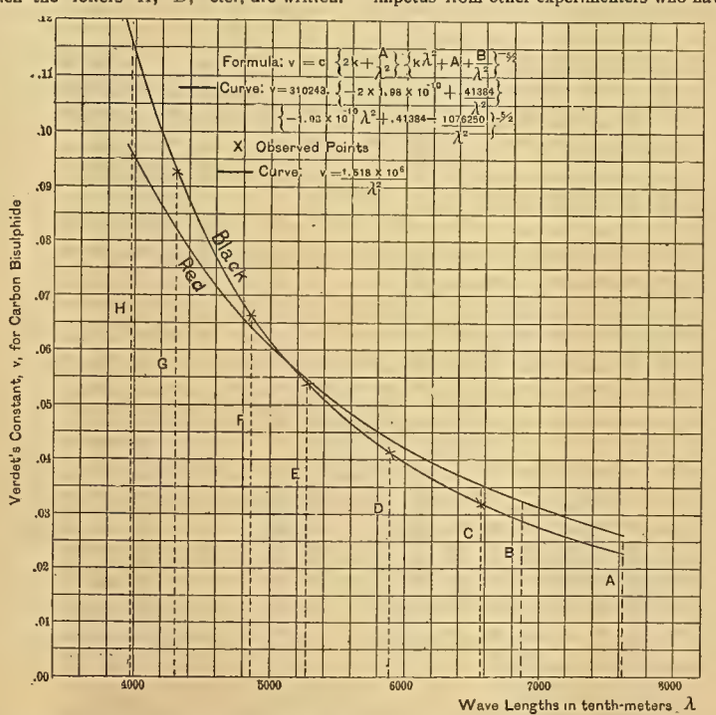

FIG. 5. A RELIABLE METHOD OF RECORDING VARIABLE CURRENT CURVES.

These letters show the positions of the various Fraunhoffer lines, and one parabola is drawn for each line. Each parabola then corresponds to one setting of the analyzer such that the dark band is found at these lines of the spectrum for zero current. The upper parabola is at the red end and the lower at the blue end of the spectrum. The axis of current is the base line of the diagram, and currents to the left of the vertical line are called negative, while those to the right are called positive. The axes of all the parabolas coincide with each other and with that of the current, and for a given quartz plate they all intersect this axis at the same point, so that taking different settings of the polarizer is equivalent to changing the parameter only of the parabola.

The interpretation of these results may be put as follows: If we have a spectrum in which the wave lengths are proportional to the distances along the spectrum (which is the case with Professor Rowland's arrangement of a concave grating), then the displacement of the dark band to one side or the other, due to the current, will be exactly according to the shape of these parabolas near the zero point, that is, near the vertical line lettered *A*, *B*, etc. Since it appears that each parabola at such a great distance from the origin is nearly a straight line, the displacement in such a spectrum will be nearly proportional to the current.

A noticeable feature, easily revealed by the graphical construction, is that in the red end of the spectrum, where the inclination of the parabola to the i axis is the greatest, the motion of the band will be the greatest for a given current.

Of course, it is understoood that this construction has to do with the relation between the wave length and current, and not between the displacement and current, unless the wave length and displacement are proportional. It does not apply, for instance, to the displacement in the spectrum of most prisms. In the prisms used the red rays were so crowded together that the motion as observed was nearly the same in the red as in the blue. The width of the band, however, is for this reason narrower in the red than in the blue, a consideration of considerable practical importance.

DESCRIPTION OF SOME OF THE APPARATUS.

The tube upon which the coil carrying the current was wound was a glass tube of 1.4 cm. internal, and 1.8 cm. external diameter, and 70.15 cm. long. The tube was filled with carbon bisulphide, which was confined in the the tube by means of two plane parallel plates of glass, each 1.3 cm. thick, fitted tightly upon the ground ends of the tube. Upon this tube was wound six layers of No. 18 double cotton copper magnet wire, occupying a length upon the tube of 61 5 cm. The wire was wound so that 100 turns occupied 12.7 cm. Thus the total number of turns, 2,900, is very large considering the size of wire.

The light used was sunlight reflected from the mirror of the heliostat.

The Nicol prisms are two fine specimens which were obtained by Dartmouth College at a time when larger specimens could be obtained than may now easily be found. The width of the slit does not need to be very narrow. A width of a quarter to half millimeter will do better than a narrower one, because more light is admitted to the photographic plate, and in passing through so many different substances even sunlight is rendered comparatively feeble by the time it strikes the photographic plate.

A further description of the apparatus is hardly deemed to be necessary, inasmuch as no claim is made to having obtained more than the most crude of first results, which may be the results attained by apparatus arranged in a comparatively poor manner for the end sought. Yet the results obtained seem to be so promising for the future that the subject is presented to you at this early date in the experiment in the hope that it may soon receive an impetus from other experimenters who have better facilities than those at my disposal, and thus become a fruitful source of extending our knowledge of instantaneous current flow in conductors.

The objections which most naturally suggest themselves against this method of taking current curves are, perhaps, the following: The photographic plate must move so quickly that the time of exposure of any one part of the plate is extremely short. To meet this demand the most sensitive plates that can be made should be used. The width of the band with any given plate depends largely upon the time of exposure. Then, too, a plate is to be desired that will photograph toward the red end of the spectrum as well as in the blue. The band does not possess very sharp outlines, but gradually shades off from dark to light.

These objections do not have so much weight, however, in cases where the general direction of the variation of the current is what is wanted more than any exact measurement of its amount, and in the majority of cases this is really what is wanted. Yet it cannot be said that in these preliminary experiments the band used was nearly as sharp as may be obtained.

Another objection of a different nature that seems difficult to avoid is the fact that the coil, which is wound upon the tube, must necessarily possess a small amount of self-induction. It may be said, however, that even though we are prohibited from measuring certain currents on account of this self-induction, we are always sure that we are measuring the exact current which is flowing through the coil.

A MORE EXACT EXPRESSION OF THE RELATION BETWEEN THE WAVE LENGTH AND VERDET'S CONSTANT.

The approximate relation between the wave length and Verdet's constant used above was that Verdet's constant varied inversely as the square of the wave length. It is considered of sufficient interest to inquire just how nearly this is an approximate formula.

By reference to equation (2) it is evident that if we only knew the relation between the index of refraction and the wave length, we might obtain the relation between the wave length and Verdet's constant in terms of these two quantities alone and constants.

Such a relation is afforded by Briot's formula, which is a modification and improvement upon the well-known formula of Cauchy. This is

$$1/n^2 = k\lambda^2 + A + B/\lambda^2 + C/\lambda^4, \qquad (14)$$

where n is the index of refraction corresponding to the wave length λ, and k, A, B, etc., are constants for the given substance. Assuming that all terms beyond B/λ^2 are negligible, we may differentiate with respect to λ and obtain the equation:

$$-\frac{\lambda}{n}\frac{dn}{d\lambda} = n^2\left(\frac{B}{\lambda^2} - k\lambda^2\right). \qquad (15)$$

Upon elimiuating B/λ^2 between (14) and (15) we obtain

$$-\frac{\lambda}{n}\frac{dn}{d\lambda} = 1 - 2kn^2\lambda^2 - Ak^2. \qquad (16)$$

Substituting in (2) the expression thus obtained, we have

$$v = c\,n^5\left(2k + \frac{A}{\lambda^2}\right). \qquad (17)$$

But by (14)

$$n^5 = \left(k\lambda^2 + A + \frac{B}{\lambda^2}\right)^{-\frac{5}{2}} \qquad (18)$$

Hence

$$v = c\,(2k + A/\lambda^2)\left(k\lambda^2 + A + \frac{B}{\lambda^2}\right)^{\frac{5}{2}} \qquad (19)$$

This formula represents to a high degree of accuracy the observed values of Verdet's constant for carbon bisulphide. It probably would for any other substances, but carbon bisulphide is the only one to which it has been applied by me. The constants k, A and B may be found by means of equation (14) and the observed values of the refractive index for known wave lengths. The values used are those observed by Messrs. Gladstone and Dale. (See Glazebrook's Physical Optics, page 243.)

Line of spectrum.		Index of refraction for Carbon Bisulphide.
A	7621	1.6142
B	6870	1.6207
C	6563	1.6240
D	5893	1.6333
E	5270	1.6465
F	4861	1.6584
G	4308	1.6836
H	3969	1.7090

These values give the red curve in Fig. 4. The lines *A*, *F*, and *H* were selected, and three simultaneous equations formed from (14), so that the resulting black curve should pass through these three observed points.

The values

$$k = -1.98 \times 10^{-10} \qquad (20)$$

$$A = .41384 \qquad (21)$$

$$B = 1076250. \qquad (22)$$

were obtained by the determinant solution of these three simultaneous equations. The resulting black curve may not appear to coincide very closely with the red, but it must be remembered that the origin of co-ordinates is a long distance below the paper, and the apparent differences are but a very small fraction of the whole. The unit is the tenth meter for wave lengths.

Having these contants they may now be substituted in (20) and c determined from the observed values of Verdet's constant. These observed values are:

Line of Spectrum.		Verdet's Constant for Carbon Bisulphide.
C	6563	0.0319′
D	5893	0.0415′
E	5270	0.0537′
F	4861	0.0667′
G	4308	0.0920′

The constant thus determined, where a minute is the unit of angle, gives

$$c = 310243 \qquad (23)$$

Using these constants for equation (19), we obtain the black curve in Fig. 5. The points marked × are the observed values and the calculated curve practically passes through them all.

The red curve in this diagram represents the approximate law that Verdet's constant is inversely as the square of the wave length, and the degree of the approximation may be observed.

The Chicopee Street Railway company at Chicopee, Mass., will organize with $100,000 capital stock to build an electric street railroad from Holyoke to Springfield. The directors are Charles C. Abbey of Chicopee, James E. Delaney of Holyoke, Selig Manilla of Springfield and others.

The Guadalajara Electric Light Installation, Utilizing the Juanacatlán Water Falls in Mexico.[1]

By Rafael M. de Arozarena.

Among the industrial enterprises taken up in Mexico by local capital, the plant for the supply of the electric light and power in the city of Guadalajara, Jalisco, is one of the most notable, not merely because of its magnitude with respect to the investment required, but also because the project necessitated the use of novel and special machinery, the source of supply being located 17 miles from the base of demand.

The problem was to install at the falls of Juanacatlán (the Niagara of Mexico) a hydraulic and electric plant which should be capable of supplying in the city of Guadalajara —distant 17 miles—sufficient electric energy to operate some 950 horse power in the form of light, divided up as follows: Seven thousand five hundred incandescent lights of 16 candle power each and 200 arc lights of 2,000 candle power each.

After careful consideration and study, the plans were projected and the machinery ordered from the following well-known houses: The electric machinery and material from the Thomson-Houston International Electric company of Boston, Mass.; the turbines and piping from James Leffel & Co. of Springfield, O.; the valves from the Ludlow Valve Manufacturing company; the countershaft, clutches, pulleys and bearings from the Hill Clutch company of Cleveland, O., and the iron poles for carrying the wire on the main line from the falls to the city—a distance of 16 miles—as well as for the wires in the city, from the Reading Iron company of Reading, Pa.

The falls of Juanacatlán are on the Grande river and situated some 17 miles (28 kilometers) southeast from the city of Guadalajara. The whole volume of the river falls at this point some 58 feet in a perpendicular line, with the shores above the falls sloping gently to the stream. Below the falls the shores on both sides slope at almost at an angle of 45°, leaving but little room at the bottom upon which a building could be erected, for which reason the building was projected of three stories, as shown by the section in Fig. 1.

The work above the falls was simple and of easy execution, for, the river being very wide at this point, it is shallow, and a masonry wall some 3 feet high was built, running across the river for two-thirds of its width and at an angle of 45° to the line of the falls, the object of which was to carry the greater part of the water in the river to a given point on its left bank directly at the falls; then a raceway was formed 14 feet high by 14 feet wide, from which the conduit pipe, seven feet in diameter, carried the water down to the turbines. This conduit pipe is made of wrought iron sheets ¼ inch in diameter, riveted together, no flanges being used. At the head of the pipe is located a vent pipe to prevent the pipe from collapsing when the wooden gate, which is located at its entrance, is closed. The pipe, to conform to the nature of the fall at this point, has two elbows of 90° and one of 45°, from which on a horizontal line it connects the three turbines together, reducing its diameter from 7 to 6 feet between the first and second turbine, and from 6 to 5 feet between the second and third turbine, Fig. 2. Directly in line with the piping are located the three horizontal double Leffel turbines, and between the turbines and the conduit pipe in the connecting pipes, which are 4 feet 6 inches in diameter, are located Ludlow straightway gate valves, which are opened and shut by geared hand wheels, thereby permitting the water to be closed off from each or any of the turbines without having to stop the others.

The turbines, located on the first floor of the building, are horizontal double wheels, placed in one case; both wheels are connected directly on the same shaft, which extends out from the case on both sides, and has at each end a sheave pulley for transmitting the power, Fig. 2. Each turbine is 20 inches in diameter, and has its independent draft tube; and as the river is known to rise in the rainy season from one to two meters, the turbines were placed 16 feet above the bed of the river, with draft tubes, all 10 feet long, discharging into a well 4 inches deep (which is the average depth of the river in the dry season), making the distance from the center of the turbines to the surface of constant water in the tailrace exactly 12 inches. This mode of setting turbines with draft tubes has given the writer excellent results here in Mexico.

The power of each set of turbines is 550 horse power, making a total of 1,650 horse power. The power is transmitted from the turbines to a countershaft placed in the second floor of the building. A rope driver is used, of endless manilla, plumbago, tallow-laid rope, 1 inch in diameter, using an idler pulley on a stress car, with weight. Each pulley has 15 grooves to receive the 15 strands of rope.

The pulleys on the turbines are 42 inches in diameter and connect with clutch pulleys on the countershaft of 84 inches diameter, giving a speed of 6,594 feet per minute to the rope. This driver, when the speed does not exceed 7,500 feet per minute, by using sheaves at least 40 times the diameter of the rope, the writer has found to be very satisfactory, and on account of its duration much cheaper than belt drivers, especially for damp places.

In Orizaba, over two years ago, the writer used this driver for transmitting 188 horse power, for electric light work; the rope, which to-day shows no signs of wear, is the same one which has been used from the start, and the plant has run on an average 11 hours every night, without any interruption. Great care must be taken, however, not to put too much weight on the stress car which carries the idler pulley.

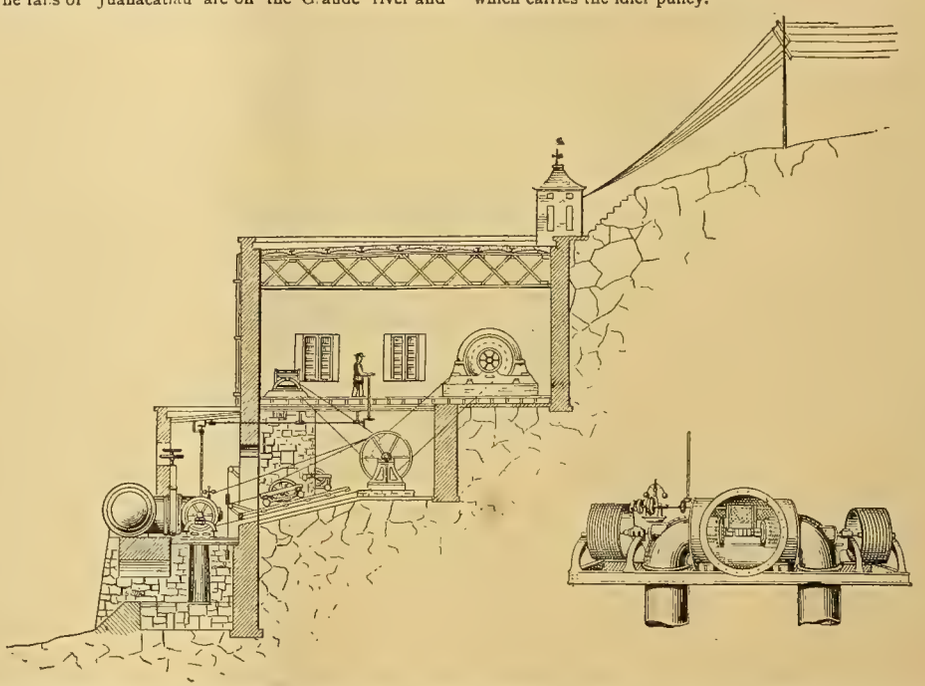

FIG. 1. THE GUADALAJARA ELECTRIC LIGHT INSTALLATION, UTILIZING THE JUANACATLAN WATER FALLS IN MEXICO.

Arc Lighting Dynamos.—For furnishing current to operate the arc lights, the familiar Thomson-Houston "M. D." dynamos were employed. They have capacity each for 50 arc lights of 2,000 candle power, or, in other words, a rated output of 25 kilowatts. The current strength is 10 amperes and consequently the maximum voltage 2,500.

The dynamos weigh 3 tons each, require floor space of about 15 square feet, a belt speed of 3,863 feet per minute, with a consumption of nearly 50 horse power under full load. Four such dynamos, Fig. 3, are in use, operated two in series to avoid multiplicity of wire. Thus, for a total capacity of 200 lights, only two circuits leave the generating station. Each dynamo is supplied with the usual ingenious and efficient "automatic regulator and controller," without which it would be well-nigh impossible to fulfill the condition. With such, however, lamps may be lighted or extinguished without the necessity of paying attention to the dynamo.

Arc Circuits.—The current is conveyed from the dynamos by means of highly insulated copper wires to a slate switchboard arranged for any desired combination of machines; from here through current indicators to the lightning arresters, from which the wires are led to the pole line. The pressure utilized being rather above the safe limit, the insulation of the circuit is augmented by fastening the wires upon oil insulators, mounted upon wooden cross-arms. The construction of these insulators is such that leakage is practically prevented, as, in order to escape by leakage, it would be necessary for the electricity not only to overcome the wire insulation, but also to pass through two strata of oil, the insulating qualities of which are well known.

In the city of Guadalajara these circuits are led to a central distributing station, in which is placed a duplicate plant of lightning arresters, switchboards and testing instruments. It is from this station that the lights are directly controlled.

Arc Lamps.—Standard double carbon arc lamps are used throughout the city. They are suspended from steel cables, stretched from corner to corner, supported by house structures arranged with pulleys and cables so that the renewal of carbons may be readily attended to.

1. Read before the American Society of Civil Engineers.

Incandescent Dynamo.—As but one dynamo was desired for this installation, one of special construction was supplied. It is of the alternating current type, has 40 pole pieces, and yields approximately 350 amperes at 1,000 volts, or 350 kilowatts. The dynamo, Fig. 3, weighs between 30 and 40 tons, requires a floor space of 216 square feet and a belt speed of 5,024 feet per minute, consuming, under full load, some 750 horse power. The armature is run at the low speed of but 300 revolutions per minute, and the shaft, which is 9 inches in diameter, is furnished with a 60 inch pulley, having 28 grooves for 1¼ inch rope, as this dynamo is driven from the countershaft with a rope driver the same as between the turbines and the countershaft. The 40 pole pieces forming the field magnets are excited by means of a separate exciter, known as "D 5," and having an output of 5 kilowatts at 125 volts.

Various indicating instruments are installed, enabling the operator to tell at a glance what load is upon either machine and at what pressure the dynamos are operating. To convey with moderate loss so great a current as 350 amperes over a distance of 17 miles would require a copper wire having a sectional area of about 4 square inches. Such a conducter could not be used, for practical reasons, to say nothing of the expense, which would be itself prohibitive. As the proper section of copper wire varies directly with the current it is necessary to carry, it is obvious that, in order to transmit such power over a wire of moderate size, the quantity of current must be reduced. Without changing the quantity of wire this may

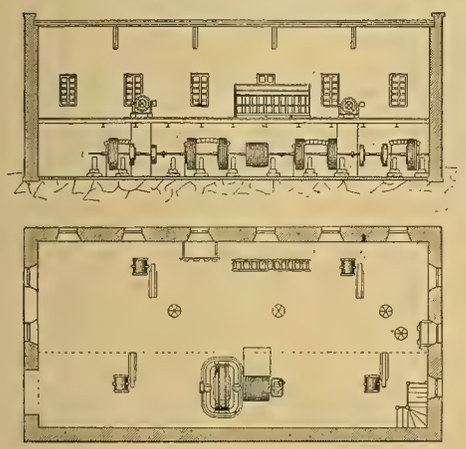

FIG. 3. THE GUADALAJARA ELECTRIC LIGHT INSTALLATION, UTILIZING THE JUANACATLAN WATER FALLS IN MEXICO.

be done by increasing the voltage, which, accordingly, was raised to a maximum of 5,000, thus reducing the current to about 70 amperes, and the size of the wire to one having a sectional area of .1662 inch.

Step-up Transformers.—To so increase the voltage from 1,000 to 5,000, a bank of 10 step-up transformers was installed These are built upon the lines of the type "F" oil transformer manufactured by the General Electric company. They transform the energy of the dynamo at an efficiency of about 98 per cent., delivering to the line, therefore, 98 per cent of the energy supplied them and at five times the pressure. The transformers are so designed as to be filled with oil, the insulating qualities of which are very high, thereby increasing the insulation resistance of the transformer, rendering it less subject to damage from lightning discharges, and, indeed, restoring the insulation, should it be destroyed by means of a stroke of lightning. The transformers are banked or operated in multiple. They have a capacity of 30 kilowatts each; weigh approximately 1,300 pounds, each requiring 12 cubic feet of space. They are protected by a simple but effective system of circuit breakers and fuse connections, and the current passing from them is carried through a special lightning arrester designed to protect circuits of extraordinarily high potential.

Main Circuit.—The cross-arms, pins and insulators used in connection with the alternating circuit are precisely the same as those described under the heading "Arc Circuits."

Step-down Transformers.—The high potential incandescent line carried to the central station in the city of Guadalajara is passed through lightning arresters and safety devices, as described above, to the bank to step-down transformers, which reduces the pressure to 1,000 volts, at which potential it is carried through the streets of Guadalajara as in ordinary installations. In the Guadalajara central station switchboards are installed, enabling any combination of lights and circuits to be made, without attention to the dynamos at the point of generation. The number of lights in operation, the physical conditions of the circuits, and indeed the conditions of the dynamos at the generating station, can all be determined in Guadalajara. Telephonic communication is established between the two stations, enabling those in charge to give their directions promptly. An exterior view of the generating station is given in Fig. 4.

As a further protection against lightning, which in the state of Jalisco is very severe, iron poles have been used, each surmounted by a pointed lightning arrester rising some 3 feet above the top of the pole, or, say, 5 feet from the highest curent conveying wire. These arresters are, of course, mechanically connected to the iron poles, besides which they are joined to each other by means of an iron wire. This is considered the most effective protection possible, as it produces an artificial "earth" above the wires conveying the electrical current.

Metropolitan Elevated Electric Railway, Chicago.

The most important electrical contract that has been closed in the United States for a year was awarded last week by the Metropolitan West Side Elevated Railroad company of Chicago. As the readers of the WESTERN ELECTRICIAN are aware, this company some time ago decided to operate its elevated railway by electrically transmitted power, being largely influenced by the conspicuous success of the Intramural railway at the World's Fair. Careful estimates were made of the relative expense of installing and operating steam and electric locomotives, with the result that a net saving of some $200,000 a year was figured in favor of the electrical system. The economy is effected by the use of cheaper fuel in the power house than is permissible under the boilers of the steam locomotives, and by the lessening of the labor bill, due to the fact that no high priced enginemen and firemen are needed on the trains. With this in view and with the object lesson afforded by the elevated electric railway in operation at Jackson Park last summer, the directors of the Metropolitan company came to the conclusion to employ electrically transmitted power. Bids for all or a portion of the electrical equipment were furnished by the General Electric company, Schenectady, N. Y.; Westinghouse Electric & Manufacturing company, Pittsburg, Pa.; Siemens & Halske Electric company of America, Chicago; Walker Manufacturing company, Cleveland, O., and Electric Construction company, London. Owing to the tariff on electrical machinery, the English company's bid was much higher than that of any American bidder. After due consideration the contract for the entire electrical equipment was, on June 22d, awarded to the General Electric company. The contract price is not known, of course, outside of the two companies immediately interested, but it is supposed to be in the neighborhood of $200,000 or $225,000. The men most active in securing the contract for the General company were Capt. Eugene Griffin and W. H. Knight of the main office and T. P. Bailey of Chicago.

The contract covers the generators, switchboard, motors, line and construction work. Four generators are provided—two of 1,500 kilowatts each, to be operated at 75 revolutions per minute, and two 800 kilowatt machines designed for 100 revolutions. Thus the total initial capacity of the station will be 4,600 kilowatts, or over 6,000 horse power. The generators will all be directly coupled to the engines, but the type and make of the latter have not yet been announced.

At the start the road will be operated on a plan calling for 55 three-car trains and consequently demanding the same number of motor cars. Each motor car will be supplied with two 100 horse power motors—one on each truck—and 110 motors will, therefore, be necessary. Series parallel controllers, improved somewhat over the type in use on the Intramural road, will be used, and the current will be transmitted to the motors by a third rail at 500 volts' pressure. In general, the system of operation in use at the World's Fair will be adopted, but many details, such as the position of the motorman, and the question of open and closed cars, remain to be settled. The apparatus will all be of the standard railway type of the General Electric company.

The management of the road is anxious to run trains early in the fall, and it is not unlikely that some temporary arrangement for obtaining power may be made if the generators are not ready for operation by that time. The Metropolitan company is already in possession of the plant of the old Throop street municipal lighting station,

FIG. 4. THE GUADALAJARA ELECTRIC LIGHT INSTALLATION, UTILIZING THE JUANACATLAN WATER FALLS IN MEXICO.

which it purchased from the city for its right-of-way, and it is possible that these engines may be utilized for a short time to drive 500 volt generators of ordinary size obtained size from the stock of the General Electric company.

The Metropolitan elevated railway will be the first permanent all-elevated road in the United States to be operated by electrically transmitted power. The main line is about five miles long, running due west between Van Buren and Congress streets, with a northern branch at Paulina street. The structure and stations are nearly completed. The location of the power house has not yet been made public.

Permit to String Wires in Chicago Revoked.

The permit granted a short time ago to the Mutual Electric Light & Fuel company, Chicago, to string wires in accordance with the terms of its ordinance, was revoked last week. James Walsh, of the Calumet Electric company, told the corporation counsel that the Mutual Electric Power & Light company did not intend to construct a power plant, at least not at present, but proposed to connect its wires with the power house of the Hyde Park Electric Light company. Objection was made to this arrangement, as it would practically give to the Hyde Park Electric Light company access to the territory withheld from it by ordinance. It was also pointed out that the intention of the council, when it passed the ordinance, and of the mayor when he vetoed the original draft and submitted the amendments which were adopted, was to afford competition in the southern district of the city. The ordinance also provided that the company construct within one year a plant to cost not less than $40,000 and that it should have a capacity of furnishing not less than 350 arc lights. In the event of the company not complying with these conditions the ordinance was to become a dead letter. On these representations the law department recommended the revocation of the permit.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago Postoffice as mail matter of the second class

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50 with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity, or any of its practical applications, is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own.* THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

PREPARATIONS for the Northwestern Electrical association's convention at St. Paul next month are now in progress, and they indicate that interest in this organization is increasing throughout the West and Northwest. It is generally admitted that a powerful organization will eventually grow out of this association. There is every reason to believe that the attendance this year will be greater than at the last convention, which was, by the way, one of the most successful meetings of an electrical organization in this country. It is a noticeable fact that in many respects the new organization has departed from the lines followed by the older associations in that it adheres strictly to the business in hand, devotes the entire time to the reading and discussion of papers and an exchange of views on subjects of practical value to the members. These meetings are not regarded by the members as holidays, but as matters of much consequence in a business sense. The list of papers contributed to the Milwaukee gathering would compare favorably with the programme provided by any of the older organizations. The Northwestern association has started on the right line; it should be encouraged, as it is deserving of success.

POWER transmission is a simple problem in this country as compared with the difficulties encountered in Mexico and Central and South American states, yet in these countries several important installations have been made, principally by American electrical companies. An interesting description of an electric plant at Gaudalajara is presented elsewhere in this issue. Water power is utilized, the falls of Juanacatlán driving the generators which supply the current for light and power in the city seventeen miles distant. It is an interesting fact that the machinery for the electrical and hydraulic plant was of American manufacture. The enterprise is one of considerable magnitude and possesses many interesting features which should be studied with care by those engaged in similar undertakings.

GERMAN electrical construction companies are much interested just now in the proposed regulations for wiring which have been prepared under the direction of the insurance companies. Hitherto little attention has been given to the rules of the underwriters, the principal companies following specifications prepared by their own experts. About two years ago the Society of German Insurance Companies decided to establish regulations which would secure uniformity of practice and raise the general standard of work. Experts were employed to investigate the subject, and it is their report that is now under discussion. The regulations are said to be based on the recommendations made by Dr. Oscar May to the Electrical Congress at Frankfort in 1891, with some modifications. Before the report received the approval of the society several large electrical concerns were asked for their views, and it is said that the proposed rules were freely criticised. Some of the companies have openly expressed their disapproval of the scheme, and signified their intention to disregard it entirely. At the present time there is a movement on foot to secure a conference of representatives of the insurance and electrical companies with the hope that an agreement may be reached.

In this country the question of adopting rules for electrical installations proved to be one of the most difficult problems that confronted the electrical people. Much of the construction work in the early days of electric lighting was poorly done, and the losses that naturally resulted made the insurance men look with suspicion or distrust upon every suggestion made by the electrical companies. This conflict continued until representatives of both interests began to work in harmony. Then a better feeling prevailed and the work progressed rapidly. The National Electric Light association took an active part in the solution of this problem, and to the efforts of the committee representing that body the success of the conference work is largely due. No doubt the same policy will ultimately be adopted in Germany. It is certainly to the interest of all concerned that an amicable agreement be reached.

A RECENT decision of the Court of Appeals of Kentucky, in the case of the Louisville Bagging company against the Central Passenger Railway company, is of interest as determining the rights of street railways in the United States. The court held that the trolley system of operating street railway cars, when properly adjusted and supervised, is not much, if any, more dangerous than horse power and much less so than steam power applied in the same way, also that while street railway cars operated by electricity go at a greater speed, "they are more comfortable, easier controlled than horse cars, and do not really obstruct the streets more or interfere unreasonably with business transacted upon them." In view of the benefit and convenience to the public of electric cars of the overhead trolley system and the comparatively little inconvenience or danger they are to individuals, the court decided that it would be going beyond its province, and contrary to the weight of judicial authority, to enjoin or limit the use of electric cars. This decision is a popular one and is indicative of the more generous feeling which is being exhibited toward electrical railways, as their operation becomes more generally understood. The judge in this case took occasion to compare the different systems of street railway traction, and in his opinion spoke of the trolley system as the only one which is practicable at the present time.

Another recent decision, rendered in Trenton, N. J., by Chancellor McGill, is equally important in relation to this subject. The case before the court was that of the Camden, Gloucester & Woodbury Electric Railway company and the West Jersey Railroad company. The latter company secured a temporary injunction against the electric company, restraining it from crossing the former's tracks and erecting poles upon its land. The court dissolved the injunction and said that electric roads are but a modified form of the horse car system and have the same rights and are under no obligations to pay extra compensation for the erection of poles upon abutting properties; that in the matter of speed and danger, the municipalities have power of regulation, and that the placing of an electric pole immediately within the curb on the sidewalk is not an additional burden upon the land for which compensation may be required.

THE awarding of the contract by which the electrical power equipment of the Metropolitan elevated railway in Chicago becomes an assured fact is one of the most important electrical events since World's Fair time. Not only is the contract itself of the first magnitude, and particularly encouraging in coming when the effects of the business depression are still with us, but it promises to mark the opening of an era of new business—that of equipping elevated railroads in large American cities with apparatus for the generation, transmission and utilization of electrical power. It will not be long before another contract of similar character will be closed in Chicago, and the directors of other elevated railway companies are very carefully considering the question of availing themselves of the pronounced economy in operation obtainable by the use of electrically transmitted power. Not only that, but it is fair to assume that the reduced cost of operation will render it possible to construct and operate at a profit elevated railways in several of the larger cities where none now exist. Experience has demonstrated—particularly in Chicago—that, with strong competition from well established surface lines, it is often difficult for the managers of steam elevated systems to show a profit when burning anthracite coal at $4 or more a ton on the locomotives and employing high-priced enginemen and firemen. By electrically transmitting the power of cheap bituminous coal burned in the power house, it is possible to at once cut the coal bill in half and also to materially reduce the labor expense. This is the enticing possibility held out to existing and prospective elevated railway companies, and the outlook, therefore, for an increasing demand for generators and motors for this use is very encouraging. It is probable, also, that the cars of elevated electric railways will be electrically lighted, so that a considerable quantity of lamps and lighting accessories will be needed in this quarter.

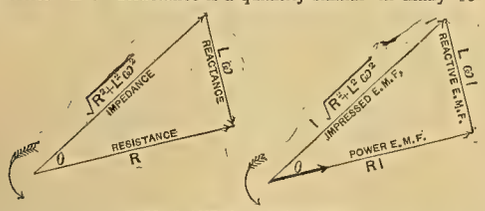
For this hopeful state of affairs the success of the Intramural railway at the World's Fair is largely responsible. Former experiments in the electrical operation of elevated railroads in the United States had been disappointing to the electrical fraternity. But with added experience, and particularly by designing generators and motors that could only err on the safe side in the point of capacity—thereby avoiding a mistake too frequently made in early American electrical construction—the road at Jackson Park was made to demonstrate to the world that there was no difficulty in constructing elevated railways that could be operated under the most exacting conditions with entire success. It is true that the road was not subjected to the test of operation amid the snow and ice of winter, but every other trying condition—heavy loads, steep grades, sharp curves and frequent stoppages—was present, and it cannot be doubted that the road could have been operated with almost equal facility in severe weather. The exposition abounded with object lessons of the utility of electricity, but none was more important than the Intramural railway, and it is entirely within the bounds of probability that the future electrical engineer will date a revolution in elevated railroad methods from the World's Fair. The economy of the electrical system appealed to the pocket-book, while a practical example showed its efficiency and reliability. The combination presents a very effective argument, and one that holds fair promise of extensive demonstration throughout the country.

It would be hardly fair to dismiss the consideration of this very interesting subject without mention of the name of B. J. Arnold. To Mr. Arnold, as the designer of the Intramural power plant and as the engineer who has devoted at least as much study to this problem as any man in the country, the thanks of the electrical fraternity are due for valuable assistance in opening up this new field.

Reactance.[1]

By Charles Proteus Steinmetz and Frederick Bedell.

The term "reactance," which has been used and advocated by the writers and others and which has been officially adopted at our suggestion by the American Institute of Electrical Engineers at its Philadelphia meeting, is one which assumes particular importance now that the term "inductance" is defined as synonymous with the "coefficient of self-induction," usually symbolized by the letter "L". Reactance is a quantity similar in many respects to resistance, but the electromotive force used in overcoming reactance consumes no power, for it is at right angles to the current.



FIGS. 1 AND 2. REACTANCE.

The impressed electromotive force in an alternating current circuit may be divided into two components: First, the power electromotive force in the direction of the current, and, second, the reactive electromotive force in quadrature with the current to overcome the reactance. The reactive electromotive force is the product of the current and the reactance. The reactance is, accordingly, equal to the component of the impressed electromotive force at right angles to the current, divided by the current. Reactance is measured in ohms.

The reactive electromotive force in the circuit may be due to self or mutual induction, to capacity or to some outside counter electromotive force produced by a motor or other device. In general, in any alternating current circuit,

Impressed E. M. F.

$$= \sqrt{\text{Power E. M. F.}^2 + \text{Reactive E. M. F.}^2};$$

that is, the impressed electromotive force is the vector sum of the electromotive force which transmits power and the reactive electromotive force.

Reactance tends to cause a phase difference between current and electromotive force. If θ represents this angle of phase, we have the relation,

$$\tan\theta = -\frac{\text{reactance}}{\text{resistance}}$$

When θ is negative, the current lags behind the electromotive force; when θ is positive, the current is in advance of the electromotive force. The expression for the instantaneous value of the current may be written,

$$i = I \sin(\omega t + \theta),$$

or

$$i = \frac{\text{Impressed E. M. F.}}{\text{Impedance}} \sin\left\{\omega t - \text{arc tan}\frac{\text{reactance}}{\text{resistance}}\right\},$$

A few illustrations of particular cases will make the use of the term reactance more clear.

Circuits Containing Resistance and Inductance.—In a simple circuit containing resistance and inductance, the reactance is equal to $L\omega$; that is, it is 2π times the product of the inductance and frequency. The impedance being the vector sum of the resistance and reactance, is

$$\text{Impedance} = \sqrt{R^2 + L^2\omega^2},$$

where $\omega = 2\pi \times$ frequency. In this case all the power is used in overcoming resistance, and the power electromotive force is equal to the ohmic electromotive force RI. The reactive electromotive force is equal to the inductive electromotive force $L\omega I$; hence

Impressed E. M. F.

$$= \sqrt{\text{Power E. M. F.}^2 + \text{Reactive E. M. F}^2};$$ or

Impressed E. M. F.

$$= \sqrt{\text{Ohmic E. M. F.}^2 + \text{Inductive E. M. F.}^2}.$$

The impressed electromotive force in this case is the vector sum of the electromotive forces necessary to overcome resistance and inductance.

A consideration of Figs. 1 and 2 (in which positive direction is counter clockwise) will show that the reactance and reactive electromotive force are positive in the case of a circuit containing inductance. The impressed electromotive force, which is the sum of the two, is therefore in advance of the current, which is in the same direction as the power or ohmic electromotive force. The current is indicated by a closed arrow in the figures. The same, however, may be otherwise expressed if we take the impressed electromotive force as our direction of reference, by saying that the current lags behind the electromotive force by the angle θ, which angle is negative, therefore, for circuits with inductance according to the relation

$$\tan\theta = -\frac{\text{reactance}}{\text{resistance}} = -\frac{L\omega}{R}$$

The value of the current at any instant is given by the equation

$$i = \frac{E}{\sqrt{R^2 + L^2\omega^2}} \sin\left(\omega t - \text{arc tan}\frac{L\omega}{R}\right)$$

Circuits Containing Resistance and Capacity.—In such circuits the reactance is equal to $-\frac{1}{C\omega}$, where C, capacity, and $\omega = 2\pi \times$ frequency, that is, it is negative. The reactive electromotive force is also negative, being equal to $-\frac{I}{C\omega}$. This negative reactance gives a positive value to the angle θ, and the current is accordingly in advance of the electromotive force. We have then

$$\text{Impedance} = \sqrt{R^2 + \frac{1}{C^2\omega^2}}$$

and

$$\tan\theta = -\frac{\text{reactance}}{\text{resistance}} = +\frac{1}{CR\omega}$$

similar to the corresponding equations above. The instantaneous value of the current is given by the equation

$$i = \frac{E}{\sqrt{R^2 + \frac{1}{C^2\omega^2}}} \sin\left(\omega t + \text{arc tan}\frac{1}{CR\omega}\right)$$

These relations are shown in Figs. 3 and 4.

Circuits Containing Resistance, Inductance and Capacity.—In a circuit containing inductance and capacity the reactive electromotive force is the sum of the inductive electromotive force and the condenser electromotive force; that is,

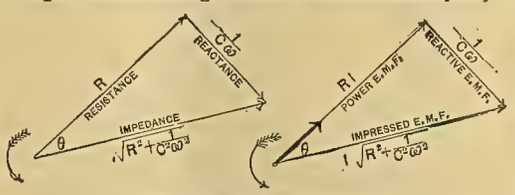
$L\omega I - \frac{I}{C\omega}$. The reactance is similarly the sum of two terms, $L\omega - \frac{1}{C\omega}$; thus, the reactance is positive or negative, according to whether the inductive electromotive force is greater or less than the condenser electromotive force. Whether the current is behind or ahead of the impressed electromotive force depends upon the same condition, for

$$\tan\theta = -\frac{\text{reactance}}{\text{resistance}} = \frac{1}{CR\omega} - \frac{L\omega}{R}.$$

The value of the current at any instant is

$$i = \frac{E}{\sqrt{R^2 + \left(L\omega - \frac{1}{C\omega}\right)^2}} \sin\left\{\omega t + \text{arc tan}\left(\frac{1}{CR\omega} - \frac{L\omega}{R}\right)\right\}.$$

The diagrams in Figs. 5 and 6 illustrate the case of a single circuit containing resistance, inductance and capacity.



FIGS. 3 AND 4. REACTANCE.

In the case here represented, the condenser electromotive force is greater than the inductive electromotive force, and the current is therefore in advance.

Circuits Containing Mutual Induction.—To further exemplify the use of the term reactance, let us consider a circuit containing a transformer. Beside the electromotive forces already discussed, we must consider the back electromotive force due to the influence of the secondary upon the primary circuit. This may be resolved into two components, one in the same direction as the current, and the other in quadrature with it, which will form part of the power electromotive and reactive electromotive forces, respectively. The electromotive force introduced by a motor is treated in the same way.

These illustrations will suffice to show the method by which any electromotive force in a circuit is resolved into two components, one in the direction of the current, which therefore transmits power, and the other at right angles to the current, which represents no power, but simply overcomes the reactance.

It is to be borne in mind that the terms here given may be used in all alternating current circuits, whether the current is harmonic or not; for, when the current is not strictly harmonic, we may consider it equivalent to an harmonic current. The equivalent harmonic current and equivalent harmonic electromotive force have the same square root of mean square values as the actual current and electromotive force, and have such relative phase positions that the same power is transmitted.

[1] American Institute of Electrical Engineers, Philadelphia, May 18, 1894.

Street Railway Interests in Ottawa, Ont.

The *Evening Journal*, Ottawa, Ont., devoted considerable space recently to the history of the street railway interests. Ottawa is one of the cities which thoroughly appreciates the advantage of electric traction. It is interesting to note that when the road began operations only six motor cars were owned by the company. Now the rolling stock consists of 22 open motor cars, 31 closed motor cars, four trailers, three postal cars and five sweepers, a total of sixty-five cars in all. Twenty-two miles of single track has been laid since 1891. The company, beside its rolling stock, owns two brick car sheds and offices on Albert street, and one of the finest water powers and power stations in America. The power house at the Chaudiere is fitted out with duplicate sets of dynamos and water wheels, the second sets being for use in case of accident. The electric horse power available at the power house is 1,700. A bill to amalgamate the Ottawa City Passenger Railway company and Electric Railway company has passed its final reading before the Dominion Parliament. The members of the firm of Ahearn & Soper, the Canadian representatives of the Westinghouse company, are connected with both street railway companies.

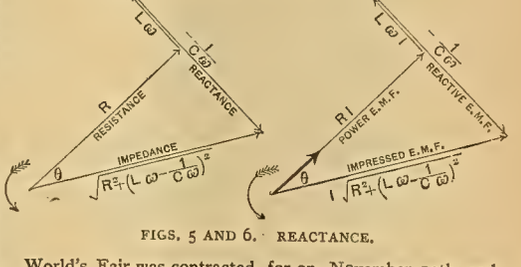
Electrical Features of the Midwinter Fair.

The lighting of the California Midwinter Exposition is noteworthy, not so much for any great novelty which has been introduced as for the success which has crowned the efforts of the management in overcoming difficulties which at one period, taking into account the limited time at disposal, seemed to be well-nigh insuperable. Following so speedily upon the closing of the World's Fair at Chicago, where about every appliance known to the electric world was exhibited, it could not be expected that novelties of application would be found at San Francisco.

The Western Electric, General Electric, Fort Wayne and Standard companies have contributed toward making this part of the exposition a success. One feature of the fair which deserves remark is the fact that the engines for driving the lighting dynamos have been almost wholly supplied by the engine builders of San Francisco. There was shown an indisposition at the initiation of the scheme by the most prominent engine builders of the city to give support either financially, or in any other way, to the exposition, unless the engine power required was supplied solely by makers on the coast. The time being very limited, this condition introduced difficulties which would not otherwise have had to be met. Any delay being fatal to the successful lighting of the exposition, the finance committee issued invitations to all the engine builders of San Francisco to state what they were in a position to supply for the purpose in a given time. The addition of annexes to the main buildings and of new concessions required that the space occupied by the power plant should be greatly increased, and the original estimate of 1,000 horse power for illumination was increased to 2,500 horse power. The installation and operation of the mechanical engineering plant was placed in the hands of Past-assistant Engineer A. M. Hunt of the Navy Department, to whose efforts is largely due the successful carrying out of the work. His energy inspired the local engine-builders with confidence, and, as stated by Lieut. W. F. C. Hasson, the chief of the electrical department, "A fair proportion of the promises made by them were ratified. The representatives of eastern companies furnished a number of high-speed engines suitable for the operation of arc light machines. The exposition, however, was still short seven hundred and fifty horse power of engines. The scrap heaps of San Francisco were ransacked, and work begun on putting two large engines in working order to meet the now imperative demand."

The electric tower in the center of the fair has proved successful and distinctive feature of the exposition. It has been lighted by the Western Electric company, and, considering the number of incandescent lamps employed, which was necessarily limited to 3,500 on the score of economy (the Western Electric company having orginally estimated that 8,000 would be necessary for a successful illumination), the effect was very brilliant and beautiful. The changing patterns and colors of the lamp designs, varying the series of attractive combinations, add very much to the effect. This changing of the designs of illumination, combined with the use made of the great searchlight on the top of the platform, forms a notable feature. The searchlight is the largest of those exhibited by the General Electric company at the World's Fair. It stands at an elevation of 272 feet.

The removal of one of the electric fountains from the World's Fair was contracted for on November 10th, and the General Electric company gave the use free of the dynamos necessary for operating the fountain and searchlight, as well as eight arc light machines and four hundred lamps now lighting the roadways and concessions, a direct current dynamo of 2,500 lights capacity used for the cornice lights and motor service, and a large alternator. This company also undertook to wire the main buildings for exterior lights and supply a railway generator for the lighting, which necessitated the adoption of a series system of connecting the lamps. This was accepted on account of its permitting more economic wiring, and proved a success.



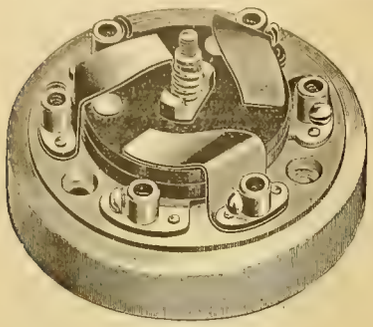
FIGS. 5 AND 6. REACTANCE.

The Fort Wayne company gave the free use of an alternating current machine of a capacity of 2,500 lights, which furnishes light for the festival hall, administration building and exposition offices generally.

The Standard Electric company furnishes four arc machines for lighting the mechanical arts and agricultural buildings.

The Western Electric company, beside the large generator for lighting the tower and some small machines for supplying current for motor service, furnishes the arc lamps and machines necessary for lighting the manufactures building.

The question of fuel for the power plant was solved by



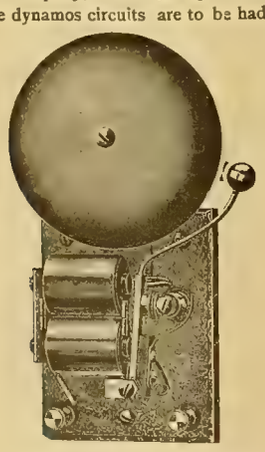
GIBBS TRIPLE POLE SWITCH.

Mr. Bart, the president of the Union Oil company of California, making an advantageous proposition for the supply of oil fuel, and thus, as at the World's Fair, the smoke and dust which the use of coal would have involved were avoided, and the boilers, supplied by the Heine Boiler company, are an interesting feature of the exposition. Four of these boilers had been in use at the World's Fair, with a capacity of 1,500 horse power, and owing to the failure of another company to have its boilers ready in time, the Heine company agreed to supply additional boilers of 1,500 horse power capacity on advantageous terms. A pair of crossed shovels painted white like the boilers and tied together with a red ribbon hangs between two of the boilers to emphasize the fact that the adoption of oil as fuel rendered unnecessary the use of labor for firing and kept everything clean and unsullied by smoke and dirt.

In the mining building there are models of the underground workings of the Standard Consolidated Mining company and the Bulwer Consolidated Mining company, showing the position of these mines, about which there was an important lawsuit several years ago, and photographic views of the Standard company's electric plant (a 12½ mile transmission) and a model of the pole line.

New Bell for Dynamo Circuits.

A new bell to work on circuits of from 50 to 500 volts, either direct or alternating, and without external resistance, is being placed on the market by the Electric Bell & Resistance company, Newark, N. J. These bells can be used where dynamos circuits are to be had. By winding a new high resistance conductor on the outside of the magnet coils, and connecting it in the manner adopted in this device there is no inductive spark at the armature contacts. Among the advantages claimed for this bell, in addition to avoiding the use of batteries, is the saving in cost of wiring, as in most cases it is only necessary to wire the bell circuits with one wire instead of two. This is accomplished by connecting the push button to the nearest service wire and running a single wire to the bell, and thence to the nearest service wire from that point. The bells are wired the same as ordinary lamps, and have cut-outs in circuit, and with this method the number of wires as well as trouble from defective wiring is diminished. The bells are mounted on a marbleized slate base, which insures perfect insulation and presents a superior appearance.



NEW BELL FOR DYNAMO CIRCUITS.

The company is placing on the market a 500 volt alarm bell for trolley cars, which has no external resistance.

Gibbs Triple Pole Switch.

The accompanying illustration represents a new three-pole snap switch recently designed by the Perkins Electric Switch Manufacturing company, Hartford, Conn., to meet the requirements of the National Board of Underwriters. It is entirely new, and has been designed especially for the Edison three-wire system. When in operation it will break the positive, negative and neutral contacts simultaneously in two places. It has a carrying capacity of 30 to 40 amperes, the only size made at present, but other sizes will probably be placed upon the market. The size is particularly adapted to be placed at the junction boxes, where the service wires enter buildings. One of these switches will take the place of two double pole switches. The Gibbs switches are also made in single and double pole in all of the required sizes. They have been on the market only a short time, but the large demand for them is gratifying to the company, which is also manufacturing a complete line of sockets and dovetail rosettes, all of which are first-class goods, made in the best possible manner, electrically and mechanically. The company is extending its business in spite of the hard times, having this year opened offices in Boston, New York, Philadelphia and Chicago. The Chicago office is

COILED FILAMENT PACKARD.

located at 1536 Monadnock building, and is in charge of G. W. Conover.

Coiled Filament Packard.

The latest addition in the Packard lamp line is the coiled filament lamp shown in the accompanying illustration. The New York & Ohio company, manufacturer of the coiled filament lamp, has moved slowly in bringing out a lamp of this kind, preferring to wait until it became fully satisfied that it was the more desirable lamp under certain conditions. Arriving at this conclusion, it began the manufacture of the lamp illustrated. The coiled filament lamp is particularly adapted to high voltages, and at present the New York & Ohio company is furnishing it only for voltages ranging from 100 to 110 volts. The coil in the long filaments, in addition to concentrating the light, also prevents the filament from falling against the bulb and shortening the life of the lamp. Further than this, it renders the filament more rigid and less likely to be affected by the jarring of the building or its support, and gives a longer life in buildings which are subject to vibration from the operation of machinery or other causes. These lamps are handled by the Electric Appliance company, Chicago.

Electricity in Insurance Matters.

At a meeting of underwriters held in Chicago, June 20th, a committee was appointed to devise ways and means for organizing an electrical bureau and laboratory. It consists of Maj. C. E. Bliven, of the union electrical committee; Eugene Harbeck, chairman of local board commission No. 2; F. Bennett, of commission No. 1; William H. Cunningham, of No. 3; E. L. Allen, of No. 4; E. M. Teall, chairman of the executive committee of the Chicago Underwriters' association, and the chairman of the finance committee of the same organization. The plan, as roughly outlined at present, is to establish a bureau for the improvement of the electrical fire hazard throughout the Northwest. This bureau is to collect and disseminate data regarding fires resulting from electricity, and educate underwriters on electrical hazards. Outside of Chicago it will labor to secure uniform ordinances providing for electric wiring and installation. In the laboratory tests will be made of all sorts of electric appliances and wiring. It is proposed to manage the bureau through the Chicago Underwriters' association, with the electrical expert of that association in charge.

Electric Alarm and Pressure Gauge.

The object of the invention shown in the accompanying illustration is to provide an electric alarm signal for high or low pressure that can be attached to all forms of pressure gauges. At the same time, it is provided with a simple means of testing the gauge to ascertain if it is in working condition at all times, and also at the same time to test the signal bell or recorder. It can be attached to both the signal bell and to the recording clock and thereby give at all times a record of the pressure when it exceeds certain limits either high or low.

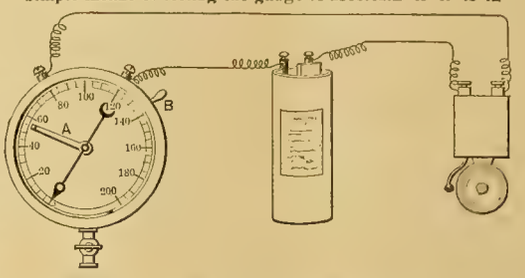


FIG. 1. ELECTRIC ALARM AND PRESSURE GAUGE.

In Fig. 1 is a plain view of the face of the common form of a pressure gauge, provided with the attachments. The small handle or finger, which is marked *B*, by being pressed either up or down, will test the gauge in either direction for high or low alarms, thus showing that both the gauge spring and the electric signal apparatus are in perfect order.

This gauge is of special value on the sprinkler systems. On the wet system of automatic sprinklers it is of great importance, as very often a defective head or other leak in a sprinkler system will start, or a fire cause a single head to go off. This one head or leak would not be sufficient to move the four or five inch check valve, to which the mechanical gong is attached, far enough to cause a positive alarm. This gauge can be set within one pound, if desired, of the pressure which is normally carried, thus indicating a leak at once. In dry systems it is valuable, because when a head goes off the air has to escape from the pipes before the water can be of any service, and thus time is lost before the alarm is given. The gauge, shown in Fig. 2, is so arranged that as soon as the head is opened and the air commences to escape, it will ring a bell long before the water will come through the pipes. It is also valuable to be used on a steam boiler, when the engineer or fireman has something else to attract his attention for a short time, and in that time the steam either raises or lowers. The gauge is manufactured and placed upon the market by the E. G. Barnard company, Troy, N. Y., and is simple, reliable and made of the best of material.

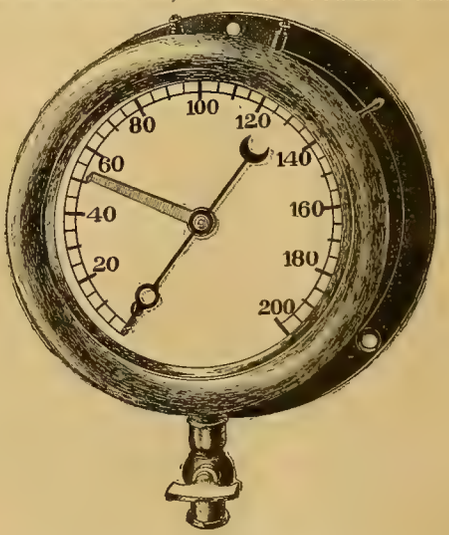

FIG. 2. ELECTRIC ALARM AND PRESSURE GAUGE.

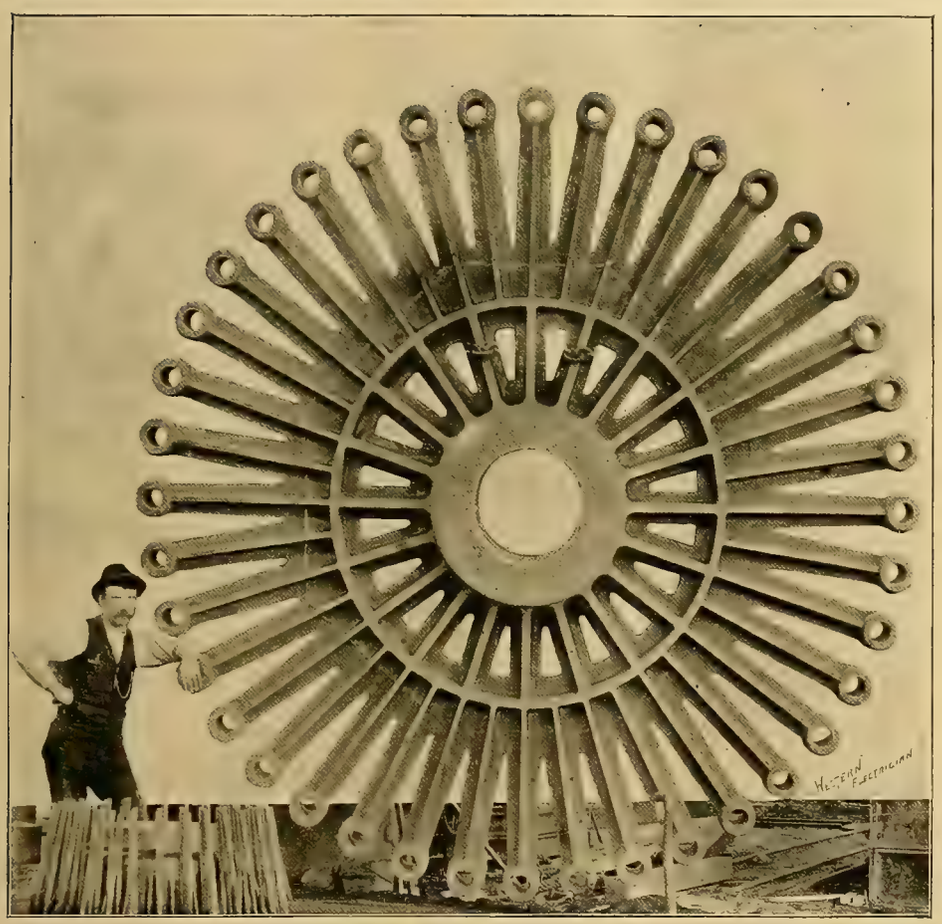
A recent issue of the *New Review* contains an article on the telephone, in which the writer, Mr. Henniker-Heaton, says he "looks forward to the time when every private house in England will be supplied with a telephone service for £3 a year, and when it will be possible to speak with America and Australia."

Large Siemens & Halske Machinery.

The accompanying illustration represents one of a pair of armature stars or carriers which are said to be the largest in the world. A pair of these has recently been made by the Wells & French company for the Siemens & Halske Electric company of America, which will install them at Toronto, Ont., for street railway service. The machines when completed will weigh about 60 tons each and have a nominal capacity of 1,200 kilowatts or 1,600 electrical horse power each, under 500 volts pressure, and will be over compounded for 12 per cent. drop in the lines. They are to be directly connected to a pair of horizontal cross compound condensing engines, making 80 revolutions per minute. The armature stars are 13 feet in diameter and weigh over 10 tons each. The brush carriers will be about 14 feet six inches in diameter and are being made by the same concern. The castings came from the mold absolutely perfect, without a warp, crack, flaw or blow-hole and are now being finished for the armature. Considering the form and size and the difficulty in making these castings, the Wells & French company is to be congratulated upon the work.



LARGE SIEMENS & HALSKE MACHINERY.

New Telephone Company in Philadelphia.

It is announced that a new telephone system is to be introduced into Philadelphia by a syndicate which has been incorporated for the purpose, which will be known as the Clamond Telephone company. The object of the company is to introduce a French system in hotels, apartment houses, country residences, etc., and in railroad service. In France the system is operated by the Home Telephone company and has been officially adopted by the French government for the use of the army and navy. Over 800,000 of the instruments are in use in France, and Philadelphians recently returned from Paris speak in the highest terms of the practical working of the system. It is the intention of the syndicate to begin operations as soon as the charter for the Clamond company is secured, and it is probable that one of the first steps will be to experiment with the new telephone for railroad service, a number of the larger railroad companies having already become interested in the project.

The interurban electric street railway between Cleveland and Akron, O., is said to be an assured enterprise. The capital stock will be $300,000, and the company to operate it has been incorporated. The road will carry passengers and freight, and will be open to contracts for carrying the mail.

American Institute of Electrical Engineers.

At the last meeting of the council of the American Institute of Electrical Engineers, June 20th, the following named associate members were elected:

William K. Archbold, Boston, Mass.; John B. Blood, Schenectady, N. Y.; Edwin H. Bennett, Jr., Elizabeth, N. J.; George S. Bliss, Pittsburg, Pa.; Frank W. Brady, Lafayette, Ind.; Francis C. Caldwell, Columbus, O.; C. C. Chesney, Pittsfield, Mass.; Arthur Edwards Childs, Philadelphia, Pa.; John E. Criggal, Springfield, Mass.; A. L. Croxton, San Francisco, Cal.; H. C. Eddy, Chicago, Ill.; Philip G. Gossler, Brooklyn, N. Y.; Frederick L. Hutchinson, Newark, N. J.; George H. Harris, Birmingham, Ala.; Frank H. Knox, Baltimore, Md; L. G. Lilley, Wyoming, O.; Herbert Lloyd, Philadelphia, Pa; James P. Malia, Chicago, Ill.; Jos. Carl Mayrhofer, New York; Maurice Oudin, Schenectady, N. Y.; Charles Plumb, Buffalo, N. Y.; Albert Scheible, Chicago, Ill.; Joel W. Stearns, Jr., Denver, Col.; George Stephens, Peterboro, Ont.; Paul A. N. Winand, Philadelphia, Pa.

The following named associate members were transferred to full membership upon recommendation of the board of examiners:

George M. Mayer, Chicago, Ill.; Franklin S. Holmes, New York; Hollon C. Spaulding, Exeter, N. H.; Henry H. Wait, Chicago, Ill; Ernest P. Warner, Chicago, Ill.; H. Fleetwood Albright, Chicago, Ill.; F. N. Waterman, New York; D. McFarlan Moore, New York; Caryl D. Haskins, Boston, Mass.; Francis G. Daniell, New Haven, Conn.; Daniel W. Shea, Champaign, Ill.; W. LeConte Stevens, Troy, N. Y.; Arthur Newhall Mansfield, New York; Gano S. Dunn, East Orange, N. J.; Charles Wirt, Chicago, Ill.

The next meeting of the council will be held on September 19th. Thirty applications for membership are now on hand for consideration on that date.

Portable Electric Lights.

There has been placed upon the market a novelty in electric lighting which might have almost numberless applications if its operation is as reliable as the claims made for it. By reference to Fig. 1 an idea may be gained of the system employed. This lamp consists of battery and headlight complete in one compact case, and resembles in appearance an ordinary oil lamp. The battery is, according to the Chicago Electric Headlight company, Chicago, the manufacturer of the article, an improved form of secondary cell, and possesses the advantage of containing no liquid. This battery may be charged by primary cells or connection may be made with an electric circuit used for lighting purposes. This style of lamp is intended for use upon bicycles, but modifications of it exist which may be used by miners, policemen and those who need a bright light for frequent use. In Fig. 2 is shown another form of bicycle lamp, which is much like that intended to be used by miners. In this type of lamp the headlight and battery are detached, the headlight being carried on the front of the wheel, and the storage battery arranged under the seat or attached to the tubing of the frame, with a wire running hrough the tubing to the lamp. This company is also producing electric lamps for houses, carriages, headlights for street cars, locomotives, etc.

FIG. 2. PORTABLE ELECTRIC LIGHTS.

Moonlight Schedule.

Following is the WESTERN ELECTRICIAN'S moonlight schedule for July:

Day of Month.	Light.	Day of Month.	Extinguish.	Number of Hours.
	H.M.		H.M	H.M.
1 ..	P. M. 8 10	2....	A. M. 3 30	7 20
2....	" 8 10	3....	" 3.30	7 20
3 .	" 8.10	4....	" 3.30	7.20
4....	" 8 20	5....	" 3.30	7.10
5....	" 9.00	6....	" 3 30	6.30

25....	" 7.50	25....	" 12.00	4 10
26....	" 7 50	27....	A. M. 12.30	4.40
27....	" 7.50	28....	" 1.10	5.20
28....	" 7.50	29....	" 1 50	6.00
29....	" 7.50	30....	" 3.00	7.10
30....	" 7.50	31....	" 3.50	8.00
31...	" 7.50	Aug. 1	" 3.50	8.00
		Total.....		137.20

The foregoing schedule was calculated on the following basis:
Light one-half hour after sunset and one hour before moonset
Extinguish one hour after moonrise and one hour before sunrise.

Accident to Thomas A. Edison.

A dispatch from New York dated June 26th states that Thomas A. Edison, last Friday night at Ogden, N. J., where is located his experimental station, met with an accident. While sitting on the porch of his boarding house his chair gave way and he was thrown backward on the porch, striking heavily. Friends at once ran to his assistance, but he picked himself up and said he felt no pain or inconvenience. Saturday night he went home to Orange, N. J. Sunday he became worse. His family physician was called in. Monday Mr. Edison was worse and unable to leave the house. It is feared that some serious internal injury may have been sustained.

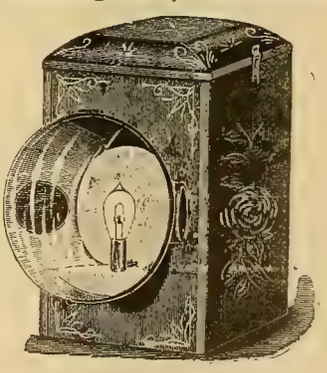

FIG. 1. PORTABLE ELECTRIC LIGHTS.

Cablegram from Mid-ocean.

An interesting cablegram was received at Chicago on Tuesday, June 26th, by the Siemens & Halske company of America. It was sent from the steamer Faraday in mid-ocean and contained the announcement that Arnold von Siemens of Berlin would reach Halifax about July 4th and that Alexander von Siemens of London would go to Ottawa, Can. Arnold and Alexander von Siemens are on the Faraday which is laying the new cable for the Postal Telegraph-Cable company, and this message was evidently sent from the ship to England by the new cable and then transmitted to New York and repeated to Chicago.

Proposed Electrical Test of Cuirasses.

There are now several so-called bullet-proof cuirasses before the public, and the question has arisen as to whether they contain metal plates other than steel or iron. With a view to testing the Dowe cuirass, the *Pall Mall Gazette* has made the following proposition:

We have devised and erected, in concert with Prof. Silvanus Thompson, F. R. S., the principal of the Finsbury Technical College, an electrical apparatus for proving whether or not the cuirass contains a metal plate, without in any way revealing the actual substance used. The apparatus consists of an induction balance arranged in the following manner: A large circular coil of fine wire is attached to the two poles of an alternating current dynamo. On either side of this is suspended a smaller coil wound on a bobbin, and connected right and left handedly in series with a telephone receiver. The position of the coils is so adjusted that the currents induced by the central or exciting coil exactly balance each other, when no vibration can be detected in the the telephone. If, however, a plate of any metallic substance, whether solid or built up, or constructed of gauze, be inserted between the central coil and either of the side coils, the balance is upset, and a clear ringing note is heard in the telephone. The action is so exact that no mistake can possibly be made, and sensitive enough to enable it to be at once detected whether the disturbance were caused by a large substantial plate or merely by fragments of bullets and steel fragments left inside the cuirass. If Herr Dowe and Captain Martin care to put their cuirass to this perfectly unexceptionable test, the apparatus is at their disposal, and we shall be pleased to invite Mr. Maxim to witness either his own triumph or his own discomfiture, and to collect a competent jury of scientific men and military experts, to be nominated by all parties concerned, in order to see the test fairly performed.

The apparatus devised for this test was exhibited before the Royal society on June 13th. It is said that Herr Dowe and Captain Martin do not desire to submit their cuirass to the proposed test.

CORRESPONDENCE.

New York Notes.

New York, June 25.—The rapid transit commissioners completed their organization last Tuesday at a meeting in the city hall by electing a secretary, counsel and chief engineer. Lewis L. Delafield, a lawer prominently identified with the City club, was selected for secretary; Henry R. Beekman and Albert B. Boardman counsel, and William Barclay Parsons, chief engineer. When the commission adjourned it was to meet on Thursday, June 28th, at two o'clock in the afternoon, in its new quarters. Meanwhile opinion of counsel will be obtained on several intricate questions in the rapid transit law on which there was a lengthy discussion at the recent meeting. Messrs. Orr, Low and Steinway were appointed a committee to call these and other law points to the attention of the lawyers.

Mayor Schieren of Brooklyn has vetoed the second series of resolutions by the aldermen granting a franchise to the New York & Eastern Telegraph & Telephone company. The first resolutions were vetoed by the mayor on the ground that the grant was contrary to public policy. The aldermen then passed the resolutions over the mayor's veto by a vote of 13 to 6. The mayor has found that the veto message was not printed in all the corporation newspapers, as required by law, and he holds that any attempt to pass the resolutions over his objections was invalid.

The New York Electrical society accepted an invitation from the officers of the Postal Telegraph company to visit and inspect its fine headquarters, Broadway and Murray street, on Tuesday evening, June 19th. Preceding the inspection the annual election of officers of the society was held in a room provided by the Postal authorities. The following named gentlemen were elected: President, C. O. Mailloux; vice-presidents, Dr. W. J. Morton, Dr. M. I. Pupin, Luther Stieringer, F. A. Pickernell, W. S. Barstow, C. S. Bradley; treasurer, H. A. Sinclair; secretary, Geo. H. Guy. Ex-President Joseph Wetzler was presented complete sets of Clerk Maxwell's and Siemens, works. Dr. C. E. Emery made the presentation on behalf of the society and thanked Mr. Wetzler for his services. Mr. Wetzler responded. The society inspected the new building, a description of which has been given in this journal. Mr. Sprague's elevator apparatus attracted much attention.

At a recent meeting of the stockholders of the United Electric Light & Power company, they authorized the president and secretary of the company to mortgage to the Union Trust company all the property, real and personal, and all the franchises, privileges and immunities of the company for $5,000,000. The money is to be used by the electric company to liquidate its floating indebtedness and to retire outstanding bonds, and also for the extension and development of the concern. Five thousand coupon bonds were issued at five per cent., aggregating $5,000,000.

There is great opposition to the extension of the trolley system at Passaic, N. J. Workmen last Friday prepared to erect poles in State street in front of the property of two families named Liebson and Davitt. They were set to work digging a hole in front of the home of Liebson. The mother and daughter, discovering this move, ran out and stepped into the hole, and there they staid, defying the workmen to molest them. The superintendent called his men away, and they started to dig in another spot. Mr. Liebson then came out and shoveled back the dirt as fast as the workmen threw it out. The laborers were more discomfited by the arrival of the relatives of Liebson. Most of the new arrivals were young women, who interfered with the laborers by grasping the shovels, while the male relatives filled up the holes as fast as dug. In spite of these difficulties the laborers succeeded in digging 10 holes, all of which were promptly filled up. At this point there was a little scuffle between one of the workmen and an old woman. She hit him and then knocked down Mr. Otis, the superintendent of the trolley workmen, who rushed in to protect the man. The police interfered and made the railroad men stop digging and dispersed the crowd of spectators. They could not, however, prevent the men from going across the street and breaking ground in front of Mrs. Davitt's building. Mrs. Davitt proved herself capable of handling the gang of men without calling for help from outsiders. A few cuffs and kicks drove them away.

W. F. O.

St. Louis, Mo.

St. Louis, June 23.—The subway commission has made a full report of its proceedings, and has submitted two bills providing for the placing of wires underground. These bills are now before the city council. The first bill provides that the city shall contract for the construction of a complete system of conduits, and that the entire system shall be leased to the city for a period of 25 years, at a fixed annual rental, the city subletting to the various wire-using companies. At the end of the 25 year lease the city is to acquire the entire system. The surplus revenue derived from rentals is to be set aside as a subway fund for this purpose. The bill provides that the last payment of purchase money shall not exceed 10 per cent. of the total cost. The city is required to maintain the conduits during the term of lease and will also construct such additional conduits as may be required during the lease, but in this case the ownership is vested in the city at once.

The board of public improvements is authorized to prepare plans and specifications for a subway system for containing all wires except trolley wires, and upon the completion of such plans to advertise for a period of 20 days, soliciting bids for the construction of the system and its leasing to the city. The plan contemplated covers that part of the city bounded on the east by the river, on the west by 22d street, on the north by Cass avenue, and on the south by Chauteau avenue, and is to be of ample capacity for all present wire-using companies with a reasonable reserve for future requirements. As many ducts as the supervisor of city lighting may designate are to be provided for city service. The work is to be divided into four equal sections, and the entire subway system completed within 24 months after the date of contract. The bill also provides for a permanent subway commission, whose duty shall be to fix the annual rental charges to be paid to the city by the several companies. The commission is to consist of the mayor, treasurer, auditor, comptroller and president of the board of public improvements, and will continue in existence during the term of the lease. A rough estimate places the cost of the subway system at $1,000,000.

The second bill is intended to complete all the minor details necessary for placing wires underground.

The Grand avenue railway has been purchased by the Union Depot Railroad company and construction will begin soon.

A report has been circulated lately that all street car lines in the city were to be consolidated. This is far from being an accomplished fact as yet. The matter has been broached to the street car companies, but they have done very little. Some of them are disposed to favor the scheme.

R. J. H.

PERSONAL.

B. J. Arnold, Chicago, left for Harrisburg, Pa., last Tuesday.

Dr. Louis Bell of the General Electric company, Schenectady, is in Chicago.

D. W. Guernsey, president of the St. Louis Electric Light & Power company, was in Chicago last week.

John A. Stewart of the Card Electric Motor & Dynamo company of Cincinnati was in Chicago last week.

M. E. Baird, general sales agent for the Eddy Electric Manufacturing company, Windsor, Conn., was in Chicago last week.

L. A. Ferguson of the Chicago Edison company returned to Chicago last Tuesday from a business trip of several days.

Benjamin M. Bruce of Bruce & Boardman, general electrical contractors, Memphis, Tenn., was in Chicago last week. Mr. Bruce combined a social trip with business interests.

Enos Bookwalter, who is well known in Detroit and elsewhere through his connection with the Detroit Electrical Works, is now connected with Frank B. Rae, 49 Wilcox street, Detroit.

B. E. Sunny of Chicago, general western manager, and W. F. Pope, Boston, second assistant treasurer, of the General Electric company, have been in Little Rock looking after the company's local properties.

W. F. White, of the power and mining department of the western office of the General Electric company, has resigned to take up other work. He formerly represented the General company at Omaha, and last summer had charge of its power transmission and mining display at the World's Fair.

The retrenchment policy that has been pursued by the General Electric company for the last eight months has brought about many administrative changes in the Chicago office. Manager Sunny has now taken personal charge of the lighting and supply departments, assisted by P. J. McFadden and F. M. Boyer for the respective departments named. Assistant Manager Bailey has direct supervision of the railway, motor, power transmission and mining departments, with the assistance of S. D. Flood for the last named department.

ELECTRIC LIGHTING.

Evart, Mich., has made a contract with the Standard Electric company of Chicago for a municipal electric light plant, which is to be completed by August 10th. Fifteen street arc lamps will be installed at first and about 300 incandescents.

The East River Electric company is being incorporated at Pictou, N. S., with a capital stock of $30,000 to supply New Glasgow, Stellarton, Westville and Ferrona with electric light produced by water power. With this object in view, the west branch of the East river of Pictou has been examined by engineers, who report that at the dryest season of the year 200 horse power may be developed by means of a dam 30 feet high, located near the village of Hopewell, N. S.

The electric illumination of the Northeast Sea canal has been let to the Helios company of Cologne, to be in operation by April, 1895. Along the two shores 884 incandescent lamps of 25 candle power each will be placed on posts 13 feet high at distances of 820 feet. Besides these lights, 68 others will serve to light better the 13 canal ferries and the four swing bridges. The locks will be lighted by 12 arc lights each, and the canal entrances will be shown by colored lights of long range. For the two stretches of 3,930 feet and 18,800 feet, where the canal traverses lakes, oil gas buoys are provided. The light stations are located at the two ends of the canal, at Holtenau and Brunsbuettel.

ELECTRIC RAILWAYS.

Plans are being made to build a new car line in Council Bluffs, Ia., running to a summer resort. Electrical business in the town is reported to be growing.

The Lanark County Electric Railway company of Perth, Ont., is applying for incorporation with a capital stock of $100,000, to build and operate an electric street railway in that town.

A bill has been introduced into the Massachusetts Legislature incorporating a company with a capital stock of $3,000,000 to operate the Boynton bicycle railway between Boston and Lowell. Electricity is the motive power of the system.

An express train on June 18th struck a trolley car about a mile from Paterson, N. J., and badly injured all the passengers. The gates at the crossing were up through the carelessness of the tender, and a freight train limited the view of the motorman.

A motorman on a Calumet electric railway car lost control of his car on the grade near One Hundred and Sixteenth street and Michigan avenue crossing in Chicago, June 24th, and it ran into a moving freight train on the Chicago & Eastern Illinois road. The car was filled with people most of whom received injuries in jumping. The electric car was

completely wrecked. The rails were wet, the brakes failed to hold the car, and the motorman did not reverse the motor in time to check its speed.

Steps are being taken to connect Hamilton and Toronto, Ont., by an electric road. It is proposed to run freight cars during certain portions of the day for the accommodation of farmers between the cities. Double decked passenger cars are favored.

Arrangements have, it is stated, been made by an English company for the establishment of a system of electric tramways in Havana, Cuba. The projected line covers about 20 miles in all, and is to connect the principal wharves and thoroughfares with the existing tramways.

A serious accident occurred June 10th on the Macon and Indian Springs electric car line, three miles north of Macon, Ga. The uncontrollable speed of the car as it turned a sharp corner threw out four persons 25 feet upon the rocks, and all sustained serious, although not dangerous, injury.

The rails for a new electric railroad in San Francisco, Cal., are being laid on Third street from Market street to the Southern Pacific depot. The horse car line which will thus be supplanted was the pioneer company in San Francisco, and the road has been operated from North Beach to the railroad depot since 1862.

A sweeping decision in favor of electric railroads was given by Chancellor McGill recently in a case in which the Camden, N. J., Gloucester & Woodbury Electric Railway company is interested. It had been enjoined temporarily from crossing the tracks of the West Jersey Railway company at Woodbury. The chancellor dissolved the injunction, holding that the electric system was but a modified horse railway system, and that companies had a right to erect poles along streets and highways without abutting property holders being entitled to any extra compensation.

The Gettysburg Electric Railway company recently filed a bill in equity in the United States Circuit Court asking to have the United States enjoined from prosecuting the condemnation proceedings to acquire the property of the railway company on the Gettysburg battlefield. The constitutionality of the act upon which the proceedings are based was attacked. Judges Dallas and Butler, after hearing only part of the argument, dismissed the motion to quash the petition of the United States for the condemnation of the strip of land claimed by the company which in its possession, it was held, would disturb the battle landmarks.

Judge McConnell will soon be called upon to decide concerning the efficiency of the contact breaker which measures the amount of electricity supplied by the Siemens & Halske company to the West & South Town Railway company, Chicago, for the operation of the electric line on Twenty-second street. Counsel for the Twenty-second street line charged the Siemens & Halske management with contempt of court for the alleged violation of an injunction restraining it from cutting off the current of electricity. The attorney for the Siemens & Halske Company said the stoppage of power was caused by the breaking of the contact breaker.

It appears that in Brooklyn the trolley car is used to catch pickpockets with. On Greenpoint avenue the other day a fellow snatched a lady's pocketbook and ran. The lady screamed. A trolley car was standing near by. The motorman gave his lever a yank and started in hot pursuit of the thief, who, not suspecting such a proceeding, cantered gayly down the street leaving the woman yelling on the sidewalk. He didn't even take the trouble to turn into a side street, and as a result the electric car overtook him within two blocks, and while the motorman sat on him the conductor called a policeman. The pickpocket threatens to have the street car employes prosecuted for running faster than the law allows, but as he will probably be in Sing Sing within a few days the threat is not taken seriously. Meanwhile gentlemen of larcenous instincts are confining their operations to streets upon which only horse cars are run.

TELEPHONE.

On June 13th the Bell Telephone company declared its regular three per cent. dividend, but the directors found that recent heavy loss of business would not warrant its issuance. This action was the cause of considerable surprise, it is said, and the company's stock fell from 203 to 197 within a few minutes.

TELEGRAPH.

The franchise granted to the New York & Eastern Telegraph & Telephone company to introduce a telegraphic system into Brooklyn has been vetoed by Mayor Schieren.

Judge Seeds has granted the receivers of the Atchison, Topeka & Santa Fe Railroad company time to show cause why an injunction should not be issued to restrain them from interfering with the Postal Telegraph company in the construction of a telegraph line along the railroad. The Postal company claims to have a contract with the railroad company granting it right of way, which the receivers refuse to recognize.

The police department of Boston astonished the public on June 21st by sending officers around to the hotels and the leading barrooms in the business district, and ordering all the stock tickers taken out at once. The tickers that have been ordered out, curiously enough, all belong to one company it is said. The machines of the United Telegraph company have not yet been disturbed. The company whose tickers have been objected to is the Stock Quotation Telegraph company.

Within a few months Pekin will be united by wire with St. Petersburg, and, in consequence, with the telegraph system of the entire civilized world. According to the latest issue of the *Turkestan Gazette*, the telegraph line from Pekin has been brought as far west as the city of Kashgar. The European end of the line is at Osh, and a small stretch of about 140 miles now alone breaks the direct telegraphic communication from the Atlantic to the Pacific.

The chief of police notified the superintendent of the Western Union Telegraph company at Jersey City, N. J., last week that in the future he must not receive cipher messages. The cipher messages referred to are the winning policy numbers, which are drawn in Connecticut and wired to Jersey City, to be distributed among the local policy players. The probability is, it is said, that the Western Union company will disregard the order of the chief of police, and in that event the matter will be taken before the grand jury.

The steamship Faraday sailed from Siemens Brothers' works at Woolwich, England, June 12th, having on board 1,600 miles of the Commercial company's new cable. She will proceed to a point 150 miles off the Irish coast, where she will splice on to the shore end already laid. She will then proceed to Nova Scotia, where the final splice will be made. The cable is expected to be laid by June 30th. A dinner was given on board the Faraday, at which a distinguished company was present. Among those invited were Lord and Lady Kelvin, Sir Benjamin Baker, George G. Ward, vice-president of the Commercial Cable company; Clarence Mackay; W. H. Preece, C. B., engineer-in-chief and electrician of the British Postoffice; Sir Charles Tupper, Canadian high commissioner; Arnold Von Siemens and G. H. Hambridge.

MISCELLANEOUS.

Cleveland, O., will have a double swing bridge on Columbus street that will be operated by electricity.

Judge Lea on June 16th rendered judgment in favor of the General Electric company against the Little Rock, Ark., Electric Street Railway company for $7,627. The case has been in contest for a long time.

A horde of sewer rats, which pestered a down-town restaurant keeper, have been decimated by an ingenious electrician, says the Philadelphia *Record*. The rodents came up day after day through holes alongside a grated covering of a sewer inlet in the yard back of the restaurant. The electrician offered to construct an effective trap, and he was told to go ahead. He laid coils of copper wire about the hole and made an attachment to the electric light wires within the building, supplying a key to turn on the current. A watch was kept on the hole, and when a dozen rats were running about the yard the key was turned. As the rats returned, one by one to their holes, they keeled over dead. In this novel way nearly 150 rats have been killed off in a little over a week.

An important addition to the literature of the World's Fair—a work of especial interest to electrical men—is Prof. John P. Barrett's forthcoming book entitled "Electricity at the Columbian Exposition." The volume will consist of about 600 pages, with 120 large half-tone illustrations, and will be handsomely printed, with especially designed inital letters and tail-pieces, and tastefully bound. It will contain an exhaustive description of the electrical service plant, the exhibits in electricity building, decorative lighting, searchlights, telephone and telegraph service, Intramural railway, electric launches, electric fountains, police and fire alarm service and miscellaneous electrical applications of the World's Columbian Exposition—in short, a comprehensive survey of all the electrical features of the World's Fair. The book is now in press and will be issued shortly.

TRADE NEWS.

Among the recent installations of the Detroit Electrical Wiring & Repair company, Detroit, may be mentioned a complete plant of over 500 lights for the public library, wiring the D. M. Ferry buildings for 500 lights with salamander wire, a complete installation for the Wilson flats, and a conduit system for the Detroit Museum of Art, all of Detroit.

The Peru, Ind., Electric Manufacturing company is making a special feature of its No. 2 Hercules battery. This battery consists of a fluted carbon cylinder or vase filled with a depolarizing compound. The large surface of zinc exposed makes it one of the best batteries for open circuit work. The cell is charged with six ounces of sal ammoniac and 28 ounces water and has an electromotive force of 1.47 volts; internal resistance .11 ohm, and current on short circuit about 13.4 amperes.

The Detroit Motor company, Detroit, Mich., has recently installed a 400 light plant in the drug establishment of Farrand, Williams & Clark, Detroit, including generator, Erie City engine, Detroit motor and marble switchboard. It has also installed a 300 light dynamo in the club house of the Detroit Boat club, which, it is said, is one of the finest of its kind in the United States. A complete 250 light plant has also been ordered by the Rickel Malt company, Detroit. The company's well-known fan motor is also in great demand.

The Hubley Manufacturing company, Lancaster Pa., manufacturer of electric railway and lighting apparatus, is in a position to supply the trade from its extensive stock of electrical goods. This stock includes everything in electric wire supplies, lighting supplies, street railway appliances, including P & B electrical compound, car electroliers, insulators, both glass and porcelain, construction tools, etc. The company has issued a catalogue containing a list of its goods, which gives some idea of the size of the stock which the company carries. The book is a price list, and an examination of it shows prices which are satisfactory.

The University of Wisconsin has commenced the publication of an engineering series of papers in its bulletin. No. 1, Vol. 1, is "Track," by L. F. Loree, and No. 2 is "Some Practical Hints in Dynamo Design," by Gilbert Wilkes. Judging from the value of these first two lectures, the university has adopted a wise course in preserving them in book form. Mr. Wilkes is the chief engineer of the Detroit Electrical Works, and in his lecture he has touched upon many practical points which are of much interest. The committee of publication for the university consists of Charles Kendall Adams, George L. Hendrickson, William H. Hobbs, Dugald C. Jackson and F. J. Turner.

The annual register of Purdue University, Lafayette, Ind., for 1893–1894, with the scheme of study for 1894–1895, shows the institution to be in a prosperous condition, the portion of the building which contained the foundery and woodworking shop which was damaged by fire some time ago having been repaired. A number of additions have been made to the facilities for engineering and experimental work. The electrical engineering department of the university is extensive and is designed for those wishing a thorough and practical fitting for electrical engineering. As the practical electrician needs to be acquainted with the principles of machinery and the methods of machine work, this course has been based on that in mechanical engineering, differing essentially from it only in the technical courses of the junior and senior years. To meet the demands of the technical work in this branch, nothing but the most thorough course in the fundamental facts and principles of the science of electricity and magnetism can prove satisfactory, hence, a thorough drill by means of text-books and an extended series of careful measurements with exact instruments forms the necessary preparation for the latter work. The department is well supplied with dynamo-machines, motors and testing instruments for the most advanced investigation of the various problems of electro-technics. Particular attention is given to the designing of electrical machinery and appliances. The inspection of electrical installations of various kinds is considered part of senior year work. The department is in charge of H. B. Smith, A. W. Duff, W. E. Goldsborough and F. W. Brady.

BUSINESS.

The suit of George Maitland against Alfred C. Gibson, in Philadelphia, for alleged infringement of a patent for combined gas and electric fixtures, has been dismissed.

James B. Olson, Chicago selling agent for the New York Insulated Wire company, reports business as being good. His sales for May last were in excess of those for the same month a year ago.

The Westinghouse Electric & Manufacturing company has been having great success with its new direct current series arc light system. Orders have already been booked for a sufficient number of installations to keep this department busy for some time to come. The electric generating machinery is made in 25, 40 and 60 lights capacity.

The Royal Electric company, Peoria, Ill., has recently shipped the following machines: One 1,000 light alternator; one 750 light alternator and one 70 horse power 500 volt generator to Tama, Ia.; one 500 light alternator to Richland Center, Wis., and one 1,000 light alternator to Denison, Ia. The company reports a decided increase of business.

Cameron & Gillett, electrical engineers and contractors, 49 Wilcox street, Detroit, Mich., have met with considerable success since entering the construction business. They have installed quite a number of complete electric light plants in Detroit and vicinity within the last few months and have received a number of unsolicited testimonials for their excellent workmanship.

The Metropolitan Electric company, Chicago, is introducing a novelty in the W. E. Garey battery gauge. This instrument is particularly efficient and reliable, and indicates absolutely the actual working capacity of open circuit batteries. The sales of this company continue to be of the most satisfactory character, and it is pushing the sales of the Kester arc lamp with renewed vigor.

The Electric Appliance company, Chicago, is exhibiting in its Chicago salesroom quite an elaborate line of Carpenter heating appliances, which have attracted considerable attention. The Meston motor is doing good service as an alternating fan motor that may be depended on in any kind of exacting service, and a flow of orders has commenced, which will probably continue until well along in the season.

The Machinery Supply company, Los Angeles, Cal., is opening a supply house and proposes entering the field for contracts for complete installations to include isolated plants, central stations and street railway lines and power houses. The company would also like to correspond with manufacturers not represented in Southern California and Arizona. George E. Nolan, a member of the firm, and formerly superintendent of the Fulton Iron Works, is the mechanical engineer, and H. C. Wybrow, recently superintendent of the street railway and lighting plant at Everett, Wash., is the electrical engineer.

The new vertical compound engine of 600 horse power capacity, built by the Ball & Wood company for the Chi-

cago Edison company of Chicago, which was inspected in March last by so many of the prominent eastern engineers, has been placed in position at the Twenty-seventh street station, Chicago, and is now awaiting the completion of the dynamos. Among the recent contracts secured by the Ball & Wood company are those of the engines for the Manayunk & Roxborough Incline Plane railway, for the Poughkeepsie & Wappingers Falls Electric Railway company, Athol Gas & Electric company, Geneva Brush Light & Power company, and the Morris County Electric company.

The Chicago Water Motor & Fan company, 101 Lake street, Chicago, reports that its business has been of a satisfactory character in spite of the dull times. This company manufactures an electric ceiling fan which is enjoying a large sale and which is making a meritorious record for itself during the excessive warm weather. In addition to this specialty the company also manufactures a full line of belt fans to be driven by an independent motor and an extensive line of exhaust fans, which are being widely used for power house plants in reducing the temperature in dynamo and engine rooms. The company solicits correspondence regarding its products and is in a position to give attention to orders at once.

Frank B. Rae, the well known electrical engineer of Detroit, Mich., who is doing a general constructing business, has installed a 1,000 light plant with 26 kilowatt directly connected generators and Ideal engines, in the Wayne county house. The state house of correction has accepted his specifications for a directly connected plant, which will be installed as soon as the state makes the necessary appropriation. He has also put up a 600 incandescent light plant in Everett, Mich., including an Erie City engine and a 220 volt Standard machine. Mr. Rae makes a specialty of designing dynamos and motors for manufacturers, and will make tests and reports upon steam and electric plants. His wide experience in the electrical field makes his services in great demand to those desiring an expert in installing an electric plant of any kind.

The Union Brass Manufacturing company, with offices and plant at 123-127 Ontario street, Chicago, is now pushing an aggressive exploitation of the Mosher arc lamps. This concern is the consolidation of the Chicago Nickel Works, the Reiman company, and the Mosher Electric company, and besides manufacturing the Mosher arc lamp will make cabinet hardware, hardware specialties, and will do metal plating of every description. A. Weinberg is the president of the Union Brass Manufacturing company, and will manage its affairs. The company starts with a good business man at the helm, as Mr. Weinberg was the late treasurer of the Adams & Westlake company of Chicago. With the reputation which the Mosher lamp has already to its credit, it is fair to presume that the Union company will make this branch of its business a successful one.

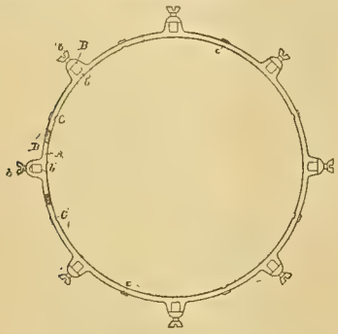
ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued June 19, 1894.

521,455. Electric Railway Signal. Charles R. Alsop, Middletown, Conn.

The invention relates to that class of electric railway signals in which a contact device is employed, and is operated by the wheel of a car to complete the circuit with a signal bell or visible signaling apparatus, and it has for its object to provide a contact device which is engaged by the flange of the wheel, and with the flange and the rail forms a part of a circuit, to avoid the use of auxiliary mechanism for communicating the motion of the wheel-operated device to a remote circuit controller, and to provide for a direct and positive operation of the parts resulting from the interposition, between the rail and the contact device, of the flange of a wheel.

521,461. Combined Annunciator and Spring Jack. Henry M. Fisk, Chicago, Ill.



NO. 521,671.

This invention relates to switchboards for telephone exchanges and comprises the combination in a switchboard of an annunciator drop adapted to hang in front of the jack and be lifted by the operator's plug as it is thrust into the jack and a trigger or arm for catching it when so raised and an electromagnet and its armature and connections by which the support is drawn from engagement with the drop when the magnet is energized.

521,514. Telephone Switch. Alfred Stromberg and Andrew Carlson, Chicago, Ill.

The invention comprises a switch located upon the receiver of a telephone, in a position conveniently to be closed by the hand of the person holding the telephone to his ear. The switch may serve to open and close the circuit through the subscriber's bell and generator, the primary circuit of his induction coil, or for any other desired purpose

521,516. Lamp Lighter. Albert H. Todd, Senatobia, Miss.

The inventor describes a lamp combined with a supplemental chamber preferably arranged as the base or stand of the lamp, this chamber containing the elements of a galvanic battery, and having electrical connection with a platinum coil at the wick by which the lamp may be lighted by rendering the battery active.

521,550. Printing Telegraph. Edwin Pope, Quebec, Que.

In carrying out this invention a series of 28 electro-magnets, each of which is capable of operating either of two different type levers, all the levers being arranged to strike a common center when operated. By this means the apparatus is capable of printing 56 different characters. Beside the 28 printing magnets, two shifting or switching magnets are provided by means of which either of the type levers of any magnet is operatively connected with the armature of the magnet at will. For controlling the circuits of all of the typewriter magnets, a series of relays is employed at the receiving station, and actuate the relays in every instance by three changes in the condition of the circuit. That is to say, in order to print any given letter or character at the receiving station, there are caused at the transmitting station, successively, three changes of the circuit and different letters are printed at will by varying the character of the changes, or the order in which the changes occur. A strong negative current, a weak negative current, a strong positive current, or a weak positive current may be sent over the line, or the line may be affected by no current at all. Each one of these conditions of the circuit affects different relays at the receiving station, and by joining them in groups of three in different orders and combinations one can operate any selected one out of the group of typewriter magnets and print any character chosen within the capacity of the apparatus.

521,553. Electric Railway Signal. Barney Samuels, St. Joseph, Mo.

This invention relates to electrically operated signaling devices for railways, by which the engineer of the moving train will automatically receive a warning signal apprising him of the condition of the road ahead.

521,562. Conduit Electric Railway. Thomas Armat, Washington, D. C.

One of the principal objects of this invention is to provide an improved form of contact device, by which the current may be conducted to the motors of the vehicles without direct engagement between the traveling contacts and the conducting leads, The invention also embraces several other improvements in electric conduit systems.

521,602. Trolley Pole Catcher. Owen G. Cates, Jr., St. Louis, Mo.

The invention consists in the provision on the reach-arm of a trolley device of improvements for releasing the tension of the trolley supporting springs upon the escape of the trolley wheel from the overhead conducting wire. The primary object of the invention is to obviate the striking of the trolley against supporting wires when it becomes wild and jumps from the trolley wire.

521,651. Electric Railway Car Motor. John C. Henry, Westfield, N. J.

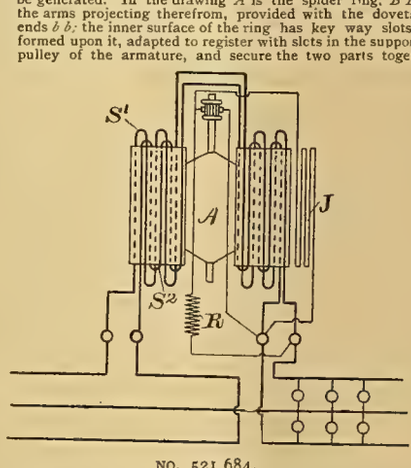
Improvements in electric motors for street railways are claimed in this invention, the objects being to simplify the construction, reduce the number of working parts, and lessen the losses usually attending the regulation of railway motors. A motor is described having a multipolar field magnet of high resistance provided with a pole changer in circuit with the field only and mechanism for operating the pole changer synchronously with the armature.

521,666. Alternating Current Regulator. Olof Offrell, Middletown, Conn.

The invention relates to electrical apparatus using an alternating current, and its object is to regulate or adjust the quantity of current consumed by the apparatus. It is especially applicable to incandescent electric lamps. The inventor avails himself of the counter-electromotive force, developed in a helix, to oppose the current flowing into the translating device. In the case of an incandescent lamp, this results in a dimming of the light; so that in such an application of the invention, it affords a means of regulating the light emitted by the lamp.

521,671. Armature for Dynamo-electric Machines. Edwin W. Rice, Schenectady, N. Y.

The invention relates to armatures for dynamo-electric machines, particularly to the spiders used in such constructions to support the core disks in place. Spiders cast in a single piece of solid metal have disadvantages on account of the eddy currents which arise in such constructions as they revolve in the field of force, which heat the spider and the armature conductors and impair the efficiency of the machine. Unsatisfactory contrivances have been devised to secure the core disks firmly in place on the spider. These two disadvantages are obviated in the inventor's construction, in which he provides a spider having radial arms provided upon their ends with dovetailed projections adapted to register with corresponding holes in the laminæ; and these arms are also provided with a lug or projection over which the end ring may be slipped, when the whole is compressed by insulated bolts, and a very rigid construction is provided. To obviate the objection of eddy currents, the inventor splits the mass of the spider arms, they being the parts which revolve in the strong magnetic field, by means of slots interrupting their continuity to such an extent as to greatly prevent the circulation of current, and also insuring, in cases where proper spacing of the laminæ is made, an efficient ventilation of the armature adapted to carry off any heat which may be generated. In the drawing *A* is the spider ring, *B B* are the arms projecting therefrom, provided with the dovetailed ends *b b;* the inner surface of the ring has key way slots *C C* formed upon it, adapted to register with slots in the supporting pulley of the armature, and secure the two parts together.



NO. 521,684.

Bolt holes *c c*, are also provided at one or more points, the bolts inserted through them serving to prevent the spider from creeping longitudinally on the face of the pulley. Through each of the spider arms is an opening *b'*, through which a part of the armature conductors may pass, the problem of passing such conductors around the projecting part of the spider in the large armatures now constructed being solved by this feature.

521,684. Meter for Recording Measurements of Electric Power. Elihu Thomson, Swampscott, Mass.

The invention has for its object to improve the construction of the recording wattmeter for which a patent has been granted the inventor and adapt it for use upon the three-wire system of distribution, as well as to adapt the meter to different potentials so that it may be used to register either between the two outside wires of the three-wire system, or between one of such wires and the neutral wire; at the same time so arranging the field magnet coils of the meter that its torque is evenly distributed around the armature, and thus in case one side only of the system is in use, or in case one side is carrying a great preponderance of the current, the registration will still be correct, and will be effected without damage to the armature. To attain the ends pointed out, the field-magnet coils shown in the drawing, which represents the connections of the armature in shunt across both the outside mains, are arranged between the outside wires of the system and distributee upon both sides of the armature *A*. The inventor arranges two independent sets of coils connected so that a part of each set is upon each side of the armature. The armature is arranged in shunt, with a resistance *R* in series with it, and a starting coil *J* is provided with just sufficient power to overcome the friction coefficient of the moving parts and in multiple with the armature and in series with the resistance.

521,685. Electric Meter. Elihu Thomson, Swampscott, Mass.

NO. 521,721.

The invention relates to improvements in electric meters such as have been described by the inventor in a former patent (448,894.) It has for its object to provide a method and means of starting such a meter under small loads and particularly to provide a means of providing an initial field or energy supplying circuit sufficient to overcome the friction coefficient of such meters. For this purpose is provided, in addition to the series coil of the meter, an auxiliary or shunt coil wound in relation to the armature in such a way as to furnish the field required.

521,711. Supply System for Electric Railways. Thomas Harris, Detroit, Mich.

The invention relates more specifically to that class of electric railways in which the motor circuit during the travel of the car is maintained in multiple connection between a sectional working conductor and a return conductor, or the ground, and in which the sections of the working conductor are automatically connected and disconnected from the power line by the operation of electric switches operated by the travel of the car. The invention consists in the peculiar construction and arrangement of the device by which the system is equally well adapted to single or double track roads, and further in the novel construction and arrangement of the switching devices by which a single magnet for each section of the working conductor controls the operation of the switching devices in a simple and efficient manner. The invention also includes an arrangement of sectional return conductor which may be used in connection with the system.

521,721. Electric Lamp for Bicycles. George Mayr, Brooklyn, N. Y.

The invention, the application of which is shown in the illustration, which is self evident and demands no particular description, consists in the combination with a bicycle having a sprocket wheel mounted on the hub of one of its wheels, a dynamo-electric generator of special design, suitably disposed upon the bicycle frame, and consisting in part, of a gearing frame piece, a horizontal armature shaft carrying a pinion, and a train of gearing mechanism, disposed in the frame piece, the initial driver of the gearing mechanism being carried by a shaft having a sprocket wheel mounted upon it and the final driver thereof being adapted to mesh at all times with the pinion on the armature shaft; an electric lamp of any approved construction, mounted on the bicycle frame, and circuit connections leading from the generator to the lamp.

The first claim of this invention reads:

A dynamo-electric generator, consisting of top and bottom frame pieces, each provided with a suitable head, having a clamping device pivotally connected therewith, suitable field magnets and a gearing frame portion, connecting the top and bottom plates, a lateral bearing piece secured to the magnets, a horizontal shaft carrying suitable armature parts, a commutator, and a pinion, the shaft being disposed transversely between the field magnets, and bearing respectively at its inner and outer ends in the gearing frame-portion and lateral bearing piece a train of gearing mechanism within the frame portion, the initial driver of the gearing mechanism being carried by a shaft having a sprocket wheel mounted thereon, and the final driver being adapted to mesh at all times with the pinion on the armature shaft, and two suitably disposed commutator brushes, one being directly connected with one of the field magnets,

An Award from the World's Fair that is a Testimonial of Real Merit.

HERE IT IS:

MECHANICAL AND ELECTRICAL DEPTS.
CHAS. F. FOSTER, MECHANICAL ENGINEER.
R. H. PIERCE, ELECTRICAL ENGINEER.

OFFICE OF
D. H. BURNHAM, DIRECTOR OF WORKS,
WORLD'S COLUMBIAN EXPOSITION,
JACKSON PARK,
CHICAGO.

December 7th, 1893.

Central Electric Co.,
Chicago, Ills.

Gentlemen:-

I beg to acknowledge receipt of yours of the 25th ult., asking about what experience we have had with the Okonite wire furnished for Fire and Police circuits at the World's Fair Grounds. I note that you received a letter from me stating that I knew nothing about this wire. The letter to which you refer was written by my Assistant during my absence, and the wire which you furnished was all used up before he had anything to do with this portion of our work.

The wire to which you refer was used nearly all, or wholly, for underground work in ducts, which were much of the time filled with water and ice, and I have never had any report of any trouble on these circuits due to the insulation of it. To the best of my knowledge they have worked satisfactorily all the time.

Yours very truly.

R. H. Pierce
Electrical Engineer.

Geo. A. McKinlock, President & Treasurer — Cable Address "MACKINLOCK-CHICAGO" — Charles E. Brown, Secretary

R. H. Pierce, Esq.,
Electrical Engineer, World's Columbian Exposition,
Jackson Park, Chicago.

Dear Sir:-

We have your valued favor of the 7th inst., and beg to thank you for the information contained therein in regard to your experience with the Okonite wire furnished you for Fire and Police Circuits at the World's Fair Grounds.

We look upon your testimony as of more value than a bushel of medals, and beg to assure you that we appreciate your kind expressions.

Yours truly,

Central Electric Co.
Geo. A. McKinlock
Treasurer.

Copy.

WRITE NOW FOR OUR NEW CATALOGUE,

Happy New Year

For the 26th Time.

1868 TO 1894.

DAY'S KERITE

The Oldest and Best High Grade Insulation for Electric Wires and Cables.

For over **quarter of a century** Kerite has held an enviable position at the head of all known compounds for Insulating Electric Wires and Cables. No other compound has ever attained to the same degree of **"excellence, high insulation, durability and reliability, under the most exacting conditions,"** as Kerite—invented by Austin Goodyear Day over twenty-six years ago and manufactured to-day by his relative and successor

W. R. BRIXEY.

The recent award at the World's Fair to **Kerite** for the above qualities over all other compounds, together with the testimonials of its users, and the enormous demand for it by the most conspicuous and important electrical enterprises in this country, prove this beyond all question.

Since we last wished you Happy New Year many interesting events have transpired in the World's History:

The monarchy of Hawaii has been overthrown.

The World's Fair with all its imposing magnificence has come and gone.

The great Ferris Wheel with all that pertained to it has become a back number, but

KERITE

like the Rock of Ages, endures forever.

CUSHING & MORSE,

The ANCHOR

Incandescent Lamp

IS THE SAFEST LAMP TO PURCHASE NOWADAYS,

BECAUSE

IT IS ANCHORED TO THE ONLY PRINCIPLE OF SUCCESS.

STERLING QUALITY, NOT CHEAP MATERIAL OR WORK.

No Lamp is Cheap that is not Good.

A bit of Correspondence:

When he ordered:

"Don't send Lamps unless you know they are good. We have been annoyed long enough with poor lamps."

When he remitted for Anchor Lamps:

"The Anchor has given better satisfaction than any other lamp we have tried. Send another barrel at once by express."

We give a Guarantee with a Meaning.
"A Lamp that Will Live."
"A Lamp we will Protect against Litigation."

Prices are right, It will pay you to write us.

ELECTRICIAN PUBLISHING CO., 6 Lakeside Building, CHICAGO.

Westinghouse Electric & Manufacturing COMPANY,

PITTSBURG, PENNSYLVANIA.

AN UNPARALLELED RECORD.

TRANSMISSION OF POWER.

The Cataract Construction Company has awarded to the **Westinghouse Company** the contract to furnish the electrical apparatus for transmitting the power of **Niagara Falls** to operate manufacturing plants, and for other purposes. This is the most important contract in the history of the electrical industry. The initial installation alone amounts to 15,000 H. P.

ELECTRIC LIGHTING.

The two largest contracts ever made in this country for **Incandescent Electric Lighting Machinery,—The World's Fair** plant and the plant for the **Louisville Gas Company,**—were both awarded to the Westinghouse Company, and the installations furnished with **Westinghouse Alternating Current Apparatus.**

ELECTRIC RAILWAYS.

The largest street railway companies in **Brooklyn, Jersey City, Philadelphia, Pittsburg, Chicago, Cincinnati, Indianapolis,** and **St. Louis,** have equipped their systems with **Westinghouse Electric Railway Apparatus.**

The above facts have undoubtedly an important meaning to all purchasers of electrical apparatus.

THE

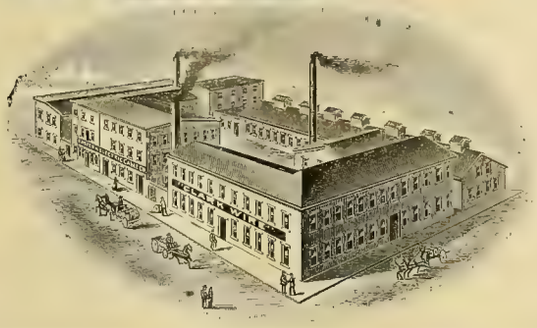
"CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

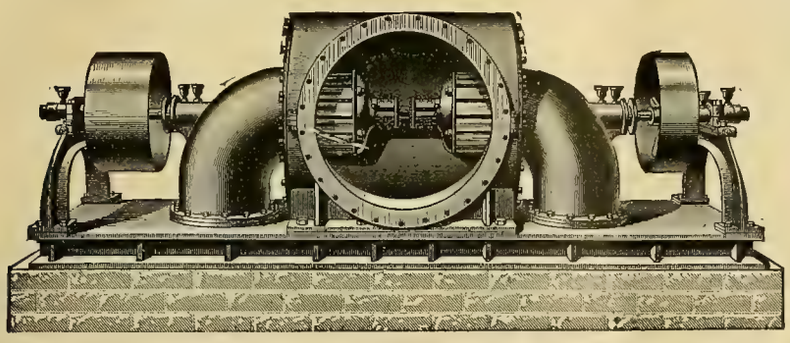
VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high speed and great Efficiency,** and **large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

SEND FOR CATALOGUE AND PARTICULARS.

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of 12 inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast-Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage,** and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

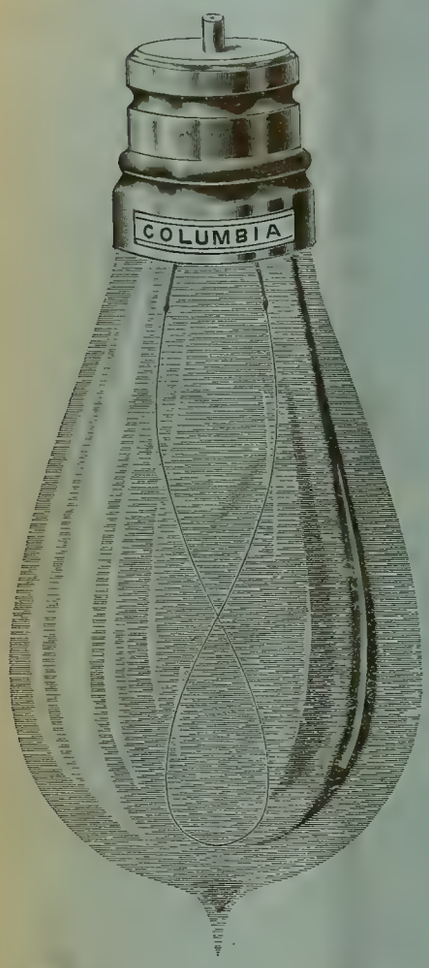
Columbia Lamps

UNEQUALED IN QUALITY.



"This lamp is lawfully made."

The policy of this company is such as to offer to users of incandescent lamps exceptional advantages and inducements to use its product. Up to the present time **our Company has been the only one whose efforts have been crowned with success in defeating the Edison Company in their attempt to secure an injunction.** We are at present taking the testimony for final hearing, and abundant facts exist to fully substantiate our claim that **the Edison Filament Patent is invalid for want of novelty.** Therefore our policy in defeating the patent will relieve all users of incandescent lamps from all claims for royalty or infringement, it matters not whose lamp has been used in the past, or whose may be used in the future. The so called non-infringing lamp may offer you temporary relief. **By the exclusive use of the Columbia Lamp we offer you permanent relief,** as our policy as outlined above is the complete overthrow of all claims for royalty. **We therefore offer to those users who will use Columbia Lamps exclusively, to protect them against all claims for royalty or infringement.** We offer to establish for them a free, untrammeled market for incandescent lamps, and there will be no possibility of tying up the lamp business on account of such claims, after the patent has expired. You will thereby secure the full benefit of a competitive market. In consequence of the decision of the United States District Court denying an injunction, **we are the only Company in the United States prepared to offer you such inducements, and having such a claim on your patronage.** We believe that the present price of incandescent lamps to-day is due largely to the vigorous fight which we have made.

We guarantee our lamps to be superior to any now in the market, and our facilities are ample for supplying lamps in any quantity desired, and we most earnestly solicit your patronage.

Before placing orders elsewhere for quantity, write us for prices.

COLUMBIA INCANDESCENT LAMP COMPANY,

1912-1914 Olive St., ST. LOUIS, MO.

KNAPP ELECTRICAL WORKS, Chicago,

AGENTS.

MASS. INSTITUTE OF TECHNOLOGY 1894 LIBRARY

Western Electrician.

$3 per Annum. EVERY SATURDAY. 10 cents per Copy.

Vol. XIV. CHICAGO, JANUARY 13, 1894. No. 2

WILLARD L. CANDEE, H. DURANT CHEEVER, } Business Managers. GEO. T. MANSON, Gen'l Supt.

THE OKONITE COMPANY LIMITED,

13 Park Row, New York.

OKONITE TRADE MARK

INSULATED WIRES AND CABLES,

For Aerial, Submarine and Underground Use.

Candee Aerial Wires.
Manson Protecting Tape.
Okonite Waterproof Tape.

BRANCHES: Chicago, Boston, Philadelphia, Minneapolis, Cincinnati, Kansas City, Omaha, Louisville, St. Louis, San Francisco, London and So. America.

THE NEW BEACON
INCANDESCENT LAMP.

PROTECTED by the "N. & C." United States PATENTS.

Lowest Price. Superior Filament. Send for REDUCED PRICE LIST. Absolutely Non-Infringing. Finest Vacuum.

Beacon Vacuum Pump & Electrical Co., MANUFACTURERS, Irvington Street, BOSTON, MASS.

NEW YORK OFFICE, 39 Cortlandt Street.

WHO SAID "INCANDESCENT ARC LAMP?"

What's the matter with a straight incandescent lamp which for the same power consumed gives a more satisfactory illumination, and is cheaper to install and operate?

This is the Packard MOGUL, made by the

NEW YORK & OHIO CO., Warren, Ohio.

200, 300 and 500 candle power, 2½ to 3 watts per candle power efficiency.

ALFRED F. MOORE,
MANUFACTURER OF
INSULATED ELECTRIC WIRE,
FLEXIBLE CORDS and CABLES.
200 and 202 North Third Street. - - PHILADELPHIA, PA.

DRY BATTERIES.
BEST OF ALL IS THE STANDARD,

Made by J. H. BUNNELL & CO., 76 Cortlandt St., New York.

Best Construction and Ingredients. Strongest, most Durable and Reliable. Size 6x2½, 60 cts. per cell. LIBERAL DISCOUNTS.

ANCHOR
Incandescent Lamp.

Most Surprising Thing in the World—
a lamp manufacturer who does not claim the earth, but furnishes a lamp which is giving complete satisfaction to thousands of users.

TRY THE ANCHOR, IT IS A GOOD THING TO TIE TO.

ARE YOU PAYING TOO MUCH FOR YOUR CANDLE?

First Cost Does Not Decide It.

THE
"AMERICAN" LAMP
IS "LONG LIVED."

St. Louis, January, 1892.

GRAND BILLIARD HALL.

In reply to your letter inquiring about service of your lamps, I am compelled to acknowledge them to be *the best lamp I have ever used* for life and brilliancy. I put in one hundred of your 24 c. p. lamps on July 8, 1891, and have quite a number of them in use yet. My average run is $10\frac{1}{2}$ hours per day for seven days a week. These lamps still maintain their candle power so well that it is almost impossible to distinguish the old from the new lamps. Respectfully,

C. A. COLLETT, *Engineer.*

THE
"AMERICAN" LAMP
IS "EFFICIENT."

After using your lamps for three months, we find in them *more than you represented* as to their life and efficiency. In proof of their efficiency we would say, we are easily carrying 276 of your 16 c. p. lamps on our dynamo, Edison pattern, while the estimated capacity of same is only 225 16 c. p. lamps at 101 volts. We are also pleased to say that, notwithstanding the overload, we are not troubled with heating of commutator or bearings, which we know to have been the case before your lamps were used on this dynamo. We will soon place another order with you. Yours truly,

St. Louis Refrigerator & Wooden Gutter Co.

THE
"AMERICAN" LAMP
IS "QUITE SATISFACTORY."

Municipal Electric Lighting and Power Co.,
Offices, 511 N. Fourth St.

St. Louis, September 14, 1892.

During the past year we have used many of your lamps and have found them *in all particulars quite satisfactory*, which you no doubt have understood because of the continuance of the orders.

Yours truly,

JAS. I. AYER, *General Manager.*

THE
"AMERICAN" LAMP
IS "MOST ECONOMICAL."

THE MOST ECONOMICAL.

We have used your American Lamp for the last six months and are very much pleased with them. Indeed, think it *the most economical lamp* that Street Railway Company can use.

Yours very truly,

SOUTHERN RAILWAY CO.

St. Louis, Mo.

SPECIAL ANNOUNCEMENT.

"THE HELIOS"

SPECIAL ALTERNATING ARC LAMP
Can be run three in series from 105 volt secondary circuit.

STANDARD ALTERNATING ARC LAMPS
Can be run in multiple from 50 or 100 volt secondary circuits by Spencer Economy Coils.

No Special Transformers Necessary. No Dead Resistance Required. No Change of Wiring.

SPECIAL NOTICE.
Helios Carbons will be sold only with the Helios Lamp. The Helios is the only lamp that has a legal right to use the reflector plate between the standards, without which one-half of the light is wasted.

MECHANICAL AND ELECTRICAL DEPTS
CHAS. F. FOSTER,
MECHANICAL ENGINEER.
R. H. PIERCE,
ELECTRICAL ENGINEER.

December 7th, 1893.

Central Electric Co.,
Chicago, Ills.

Gentlemen:-

I beg to acknowledge receipt of yours of the 25th ult., asking about what experience we have had with the Okonite wire furnished for Fire and Police circuits at the World's Fair Grounds. I note that you received a letter from me stating that I knew nothing about this wire. The letter to which you refer was written by my Assistant during my absence, and the wire which you furnished was all used up before he had anything to do with this portion of our work.

The wire to which you refer was used nearly all, or wholly, for underground work in ducts, which were much of the time filled with water and ice, and I have never had any report of any trouble on these circuits due to the insulation of it. To the best of my knowledge they have worked satisfactorily all the time.

Yours very truly.

R. H. Pierce

Electrical Engineer.

Jackson Park, Chicago.

Dear Sir:-

We have your valued favor of the 7th inst., and beg to thank you for the information contained therein in regard to your experience with the Okonite wire furnished you for Fire and Police Circuits at the World's Fair Grounds.

We look upon your testimony as of more value than a bushel of medals, and beg to assure you that we appreciate your kind expressions.

Yours truly,

Central Electric Co.

Geo. A. McKinlock

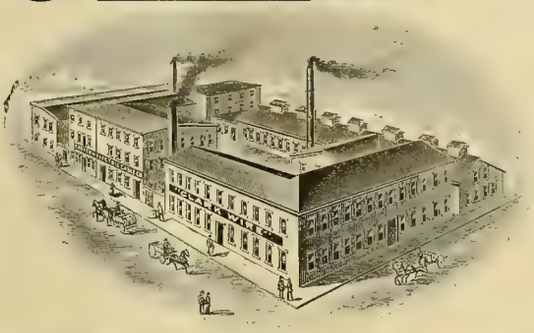
"CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage,** and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

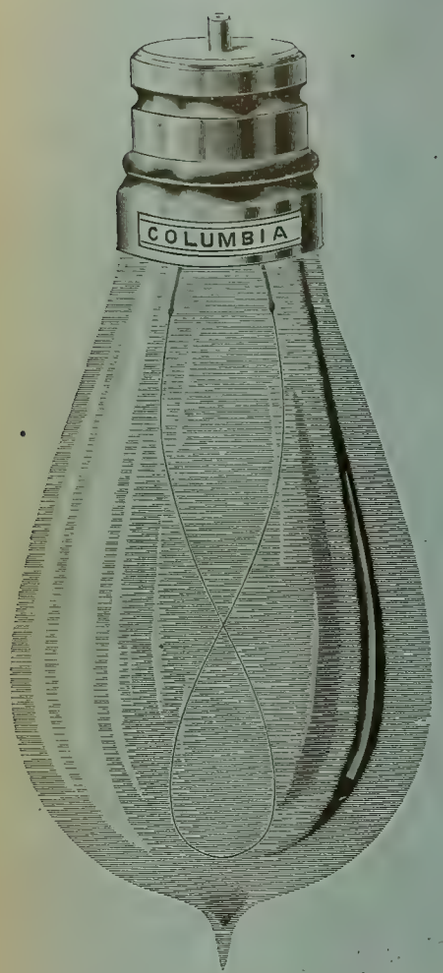
See to it that your station is equipped with modern machinery—apparatus known to be EFFICIENT, DURABLE, and SIMPLE.

Columbia Incandescent Lamps.

UNEQUALED IN QUALITY.



This "Incandescent Lamp lawfully made."

The *only Strictly High Grade Incandescent Lamp Manufactured* in the United States, under and by authority of court, by a decision rendered in our favor on the 21st day of April, 1893.

By reason of the magnificent support which has been given this Company during the past year and especially since the *decision in our favor denying an injunction* applied for by the Edison Company, we have been enabled to largely increase our manufacturing facilities, which has been the means of bringing about a *reduction* in the *price* of *Incandescent Lamps*, thereby giving all users the benefit of our splendid victory over the *Trust*.

We shall therefore make a *reduction* in the *price of Incandescent Lamps*, to take effect on and after January 10th, 1894. Price list will be furnished on application.

At the same time we shall maintain the *High Standard of the Columbia Lamp* and shall always keep pace with any improvements that may be made. Our lamps will be found to be the *most uniform* in general results of any now offered to the trade. They are *long-lived, efficient and will maintain their candle power* to the highest degree.

Our *policy* in regard to *patent litigation* and *protection to users* has been outlined during the past month in the electrical journals.

We solicit your orders on the *merit* of the goods which we produce, as well as on the policy which has been heretofore outlined.

ARE YOU PAYING TOO MUCH FOR YOUR CANDLE?

First Cost Does Not Decide It.

THE
"AMERICAN" LAMP
IS "LONG LIVED."

St. Louis, January 10, 1892.

GRAND BILLIARD HALL.

In reply to your letter inquiring about service of your lamps, I am compelled to acknowledge them to be *the best lamp I have ever used* for life and brilliancy. I put in one hundred of your 24 c. p. lamps on July 8, 1891, and have quite a number of them in use yet. My average run is 10½ hours per day for seven days a week. These lamps still maintain their candle power so well that it is almost impossible to distinguish the old from the new lamps. Respectfully,

C. A. COLLETT, *Engineer.*

THE
"AMERICAN" LAMP
IS "EFFICIENT."

After using your lamps for three months, we find in them *more than you represented* as to their life and efficiency. In proof of their efficiency we would say, we are easily carrying 276 of your 16 c. p. lamps on our dynamo, Edison pattern, while the estimated capacity of same is only 225 16 c. p. lamps at 101 volts. We are also pleased to say that, notwithstanding the overload, we are not troubled with heating of commutator or bearings, which we know to have been the case before your lamps were used on this dynamo. We will soon place another order with you. Yours truly,

St. Louis Refrigerator & Wooden Gutter Co.

THE
"AMERICAN" LAMP
IS "QUITE SATISFACTORY."

Municipal Electric Lighting and Power Co.,
Offices, 511 N. Fourth St.

St. Louis, September 14, 1892.

During the past year we have used many of your lamps and have found them *in all particulars quite satisfactory*, which you no doubt have understood because of the continuance of the orders.

Yours truly,

JAS. I. AYER, *General Manager.*

THE
"AMERICAN" LAMP
IS "MOST ECONOMICAL."

THE MOST ECONOMICAL.

We have used your American Lamp for the last six months and are very much pleased with them. Indeed, think it *the most economical lamp* that Street Railway Company can use.

Yours very truly,

SOUTHERN RAILWAY CO.

St. Louis, Mo.

CHAS. F. FOSTER, MECHANICAL ENGINEER.
R. H. PIERCE, ELECTRICAL ENGINEER.

OFFICE OF
D. H. BURNHAM, DIRECTOR OF WORKS,
WORLD'S COLUMBIAN EXPOSITION,
JACKSON PARK,
CHICAGO.

December 7th, 1893.

Central Electric Co.,
Chicago, Ills.

Gentlemen:-

I beg to acknowledge receipt of yours of the 25th ult., asking about what experience we have had with the Okonite wire furnished for Fire and Police circuits at the World's Fair Grounds. I note that you received a letter from me stating that I knew nothing about this wire. The letter to which you refer was written by my Assistant during my absence, and the wire which you furnished was all used up before he had anything to do with this portion of our work.

The wire to which you refer was used nearly all, or wholly, for underground work in ducts, which were much of the time filled with water and ice, and I have never had any report of any trouble on these circuits due to the insulation of it. To the best of my knowledge they have worked satisfactorily all the time.

Yours very truly.

R. H. Pierce
Electrical Engineer.

Geo. A. McKinlock, President & Treasurer. Cable Address "MACKINLOCK-CHICAGO." Charles E. Brown, Secretary.

R. H. Pierce, Esq.,
Electrical Engineer, World's Columbian Exposition,
Jackson Park, Chicago.

Dear Sir:-

We have your valued favor of the 7th inst., and beg to thank you for the information contained therein in regard to your experience with the Okonite wire furnished you for Fire and Police Circuits at the World's Fair Grounds.

We look upon your testimony as of more value than a bushel of medals, and beg to assure you that we appreciate your kind expressions.

Yours truly,

Central Electric Co.
Geo. A. McKinlock
Treasurer.

WRITE NOW FOR OUR NEW CATALOGUE.

Copy.

Don't make a Alternating Arc investigating

By Buying any Lamp before the

MON-ARC

Everything about it is of the very best. Brass Frame, Brass Shell, Brass Cap, Brass Rods. No tin or stovepipe iron. It combines unequaled simplicity with absence of all objectionable features heretofore present in alternating lamps. It is a **NON-STICKER** that central station men and lamp trimmers will be **STUCK** on because they don't have to **MONKEY** with it every few days, taking it down to clean and oil. Lamps for all systems. We guarantee every lamp. Write for prices.

A NEW BOOK.

NOW READY.

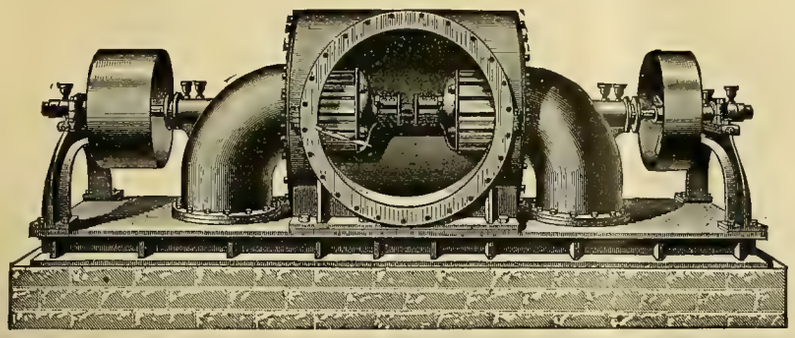
ELECTRIC TRANSMISSION HAND-BOOK.

Lieut. F. B. Badt's latest addition to our famous hand-book series, of which 30,000 copies have been sold. The new book deals in the author's well-known practical style with all the problems of Electric Power Transmission.

NOW READY. PRICE $1.00.

ELECTRICIAN PUBLISHING CO., 6 Lakeside Building, CHICAGO.

VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high Speed and great Efficiency,** and **large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

SEND FOR CATALOGUE AND PARTICULARS.

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of 12 inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast-Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage,** and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

Dictionary of Electrical Words, Terms and Phrases.

By EDWIN J. HOUSTON, A. M.

562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

The Scheme of Treatment is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

THE

BROWN MAGNETOPHONE!

The Only Successful Magneto Telephone on the Market.

We offer a premium of $10,000 for any "Electric Speaking" or other Telephone that will give better results.

Will be ready for Delivery and Installation February 1, 1894, when the last Bell Patent affecting it expires.

The United States Circuit Court for the Northern District of Illinois, in a recent suit against the Brown Telephone & Telegraph Co., said:

> **"It has what is claimed to be and what perhaps is a decided improvement."**
>
> **"These telephone patents, as I have occasion heretofore to remark, have probably been more vigorously contested than any other patents. The remaining time during which the inventor and his assigns may enjoy the fruits of the invention are short; after such a conflict the Court ought not to permit infringement during the short remaining period. . . If they must use the Bell invention to make operative the Brown improvement, they must await the expiration of the Bell patent."**

That the Brown Telephone is an improvement is evident from the fact that to-day we can refer you to a Railroad Company whose Trains have been dispatched by their use successfully for the past six months, also numerous other references.

We guarantee perfect operation over lines equal to distance between Chicago and New York.

Absolutely Free from Infringement Litigation

on the Berliner and Detail Patents, such as is certain to follow the introduction of "Electric Speaking" Telephones. As to the Berliner Patent it is conceded by all that any Magneto Telephone does not infringe the said patent. Referring to the Detail Patents in the Magneto Call Box which the Bell Co. have notified the trade they will prosecute under, we positively do not use any one of their devices; we have a complete system of our own.

WRITE NOW FOR PRICES AND PARTICULARS.

DIVIDENDS!

The **ANNUAL REPORT** of your plant, soon due, may suggest additions or betterments for the purpose of earning a larger dividend for the year 1894.

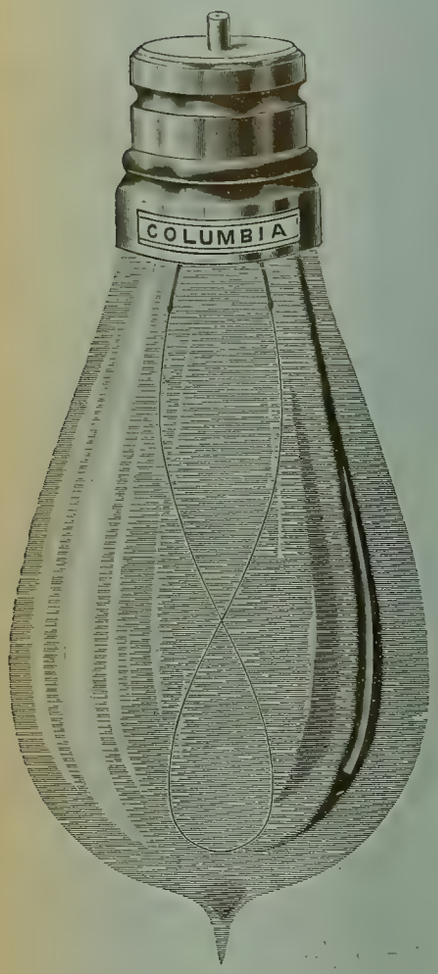
Perhaps you have not earned a dividend.

In this case there is **A CAUSE.**

See to it that your station is equipped with modern machinery—apparatus known to be EFFICIENT, DURABLE, and SIMPLE.

Columbia Incandescent Lamps.

UNEQUALED IN QUALITY.



This "Incandescent Lamp lawfully made."

The *only Strictly High Grade Incandescent Lamp Manufactured* in the United States, under and by authority of court, by a decision rendered in our favor on the 21st day of April, 1893.

By reason of the magnificent support which has been given this Company during the past year and especially since the *decision in our favor denying an injunction* applied for by the Edison Company, we have been enabled to largely increase our manufacturing facilities, which has been the means of bringing about a *reduction* in the *price* of *Incandescent Lamps*, thereby giving all users the benefit of our splendid victory over the *Trust*.

We shall therefore make a *reduction* in the *price of Incandescent Lamps*, to take effect on and after January 10th, 1894. Price list will be furnished on application.

At the same time we shall maintain the *High Standard of the Columbia Lamp* and shall always keep pace with any improvements that may be made. Our lamps will be found to be the *most uniform* in general results of any now offered to the trade. They are *long-lived, efficient and will maintain their candle power* to the highest degree.

Our *policy* in regard to *patent litigation* and *protection to users* has been outlined during the past month in the electrical journals.

We solicit your orders on the *merit* of the goods which we produce, as well as on the policy which has been heretofore outlined.

R. H. PIERCE,
ELECTRICAL ENGINEER.

OFFICE OF
D. H. BURNHAM, DIRECTOR OF WORKS,
WORLD'S COLUMBIAN EXPOSITION,
JACKSON PARK,
CHICAGO.

December 7th, 1893.

Central Electric Co.,
Chicago, Ills.

Gentlemen:-

I beg to acknowledge receipt of yours of the 25th ult., asking about what experience we have had with the Okonite wire furnished for Fire and Police circuits at the World's Fair Grounds. I note that you received a letter from me stating that I knew nothing about this wire. The letter to which you refer was written by my Assistant during my absence, and the wire which you furnished was all used up before he had anything to do with this portion of our work.

The wire to which you refer was used nearly all, or wholly, for underground work in ducts, which were much of the time filled with water and ice, and I have never had any report of any trouble on these circuits due to the insulation of it. To the best of my knowledge they have worked satisfactorily all the time.

Yours very truly.

R. H. Pierce

Electrical Engineer.

Dear Sir:-

We have your valued favor of the 7th inst., and beg to thank you for the information contained therein in regard to your experience with the Okonite wire furnished you for Fire and Police Circuits at the World's Fair Grounds.

We look upon your testimony as of more value than a bushel of medals, and beg to assure you that we appreciate your kind expressions.

Yours truly,

Central Electric Co.

ELECTRICIAN PUBLISHING CO., 6 Lakeside Building, CHICAGO.

Litigation! Litigation!

When the General Electric Company was formed by the absorption of the Thomson-Houston, the Edison General Electric and other companies, it inaugurated, for the express purpose of crushing out all competition, a policy of intimidation and costly litigation toward those users of electric machinery who had on account of superior quality of apparatus, preferred to purchase from competing companies. The officers of the Westinghouse Electric and Manufacturing Company were informed two years ago that an offer to join the Trust was open to them for a short period, on a certain basis of valuation, which basis was simply absurd. At that time it was intimated that if the offer was not accepted, a course would be adopted that would prevent the securing of orders, but in this latter particular the purchasers of electrical apparatus have decreed otherwise, as the events of the past years have shown. The Trust seems to have learned but little by experience for it has just started a series of suits against users of competing apparatus and parties who have proposed to purchase from other manufacturers. The Westinghouse Electric and Manufacturing Company defends all of its customers in the following terms: "The company shall, at its own cost and expense, defend any and all suit or suits that may be instituted by any party against the purchaser for the alleged infringement of a patent or patents, when such alleged infringement shall consist in the use of any apparatus, machinery or device, or parts thereof, manufactured and sold by the company, for which the purchaser shall have made all payments then due, provided that immediate notice of the institution of such suit or suits be given in writing by the purchaser to the company, and that the purchaser shall permit the company, through its counsel, to defend the same, and shall give all needed information, assistance and authority to enable the company so to do, and thereupon, in case of an award of damages in such suit or suits the company shall pay such award. But the company shall not be bound to defend any such suit or suits, nor to pay any damages therein, when the same shall arise by reason of the use of parts not furnished by the company."

STOPPER LAMPS. Were invented and patented by Sawyer and Man before the date of any of the inventions upon which the Trust now relies to secure to it a monopoly of the sale of incandescent lamps. These stopper lamps have been perfected and were used exclusively for the World's Fair lighting. Stopper lamps do not infringe the Edison patents, and they are cheaper and better than the Edison lamps.

FEEDER AND MAIN PATENT. By the use of our system of alternating current distribution and lamps, the use of the feeder and main feature of the Edison patent is not only unnecessary but leads to increased cost. All parties who are in any manner threatened with respect to this patent are advised to communicate with us immediately.

THREE WIRE PATENT. By the use of our system of alternating current distribution and lamps, the use of the feeder and main feature of the Edison patent is not only unnecessary but leads to increased cost. All parties who are in any manner threatened with respect to this patent are advised to communicate with us immediately.

THREE WIRE PATENT. The alternating system distributing electricity renders the three wire feature an unnecessary complication. This company is prepared to furnish plans whereby better distribution of light can be had than is possible with the continuous current system and one hundred 110 volt lamps which are necessary with it.

"Purchase apparatus and repairs at Fair prices." It has recently been announced that the General Electric Company enjoys a trade of about four millions of dollars per annum for repairs, which it is claimed cannot be interfered with. This is certainly a monstrous sum of money to be paid out by the electric fraternity for repairs. We invite correspondence from any company which is paying anything toward these four millions, with a view of putting them in a position to get their repairs and renewals at reasonable rates, or what is still better, to get apparatus which will not require such enormous amount for repairs. We would also invite correspondence from all companies who are laboring under the erroneous obligations of the famous contract form "D." We can help them also.

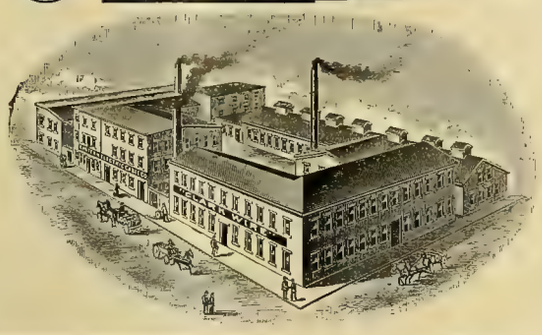
"CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

TO THE COPPER COUNTRY

Is but a little more than a night's ride in the direction of the North Star. Solid trains of coaches and buffet sleeping cars leave Chicago each night at 8 o'clock (from C., M. & St. P. Ry. depot) via the Milwaukee & Northern Railroad—the North Star Route—arriving at Champion, Mich., at 8:50 a. m., Marquette 10:25 a. m., Houghton 11:30 a. m., Hancock 12:05 p. m., and Ontonagon 9:10 p. m. This is the shortest, best and quickest route to all important points on the Upper Peninsula of Michigan. Try it. Breakfast served on trains en route. Berths may be reserved in sleeping cars one week in advance at City Ticket Office, No. 207 Clark St., Chicago.

IS YOUR PLANT RUNNING

To suit you? Did you pay a dividend last year? If you need a competent superintendent, electrician, or one to take charge of construction work, or installing machinery, I would like to correspond with you. Address **"Experience,"**

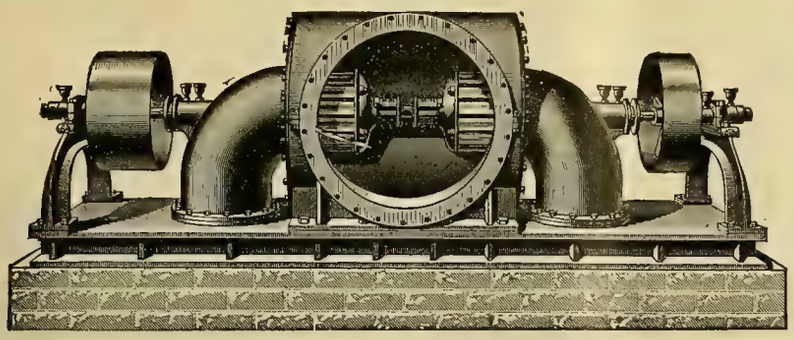
VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high Speed and great Efficiency,** and **large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

SEND FOR CATALOGUE AND PARTICULARS.

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of 12 inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast-Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage,** and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

THE JAMES LEFFEL & CO. SPRINGFIELD, OHIO, AND NEW YORK CITY.

INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

CONTENTS.

PART I.—Polyphase Currents.

CHAPTER 1....Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers
CHAPTER 3 ...The Tesla Rotating Magnetic Field.—Motors with Closed Conductors. —Synchronizing Motors.—Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18 ...Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19... Another Type of Tesla Induction Motor.
CHAPTER 20 ... Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31....."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

PART III.—Miscellaneous Inventions and Writings.

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by

DIVIDENDS!

The **ANNUAL REPORT** of your plant, soon due, may suggest additions or betterments for the purpose of earning a larger dividend for the year 1894.

Perhaps you have not earned a dividend.

In this case there is **A CAUSE.**

See to it that your station is equipped with modern machinery—apparatus known to be EFFICIENT, DURABLE, and SIMPLE.

IF a guaranteed average life of 600 hours and unsatisfactory light costs .32½, what should 800 hours guaranteed life and satisfactory light cost? Without taking into account the quality of the light the case stands

600 hours cost .32½

100 " " $\frac{32\frac{1}{2}}{6}$

800 " " $\frac{32\frac{1}{2}}{6} \times 8 = .43\frac{1}{3}$.

But we do not ask .43⅓ for our American high grade incandescent lamp. Write for quotations and further particulars.

Incandescent Lamps and Sockets for use on Arc Light Circuits,

Correspondence Solicited.

THE UNITED ELECTRIC IMPROVEMENT CO.,

Drexel Building. PHILADELPHIA, PA.

Don't make a Alternating Arc investigating

By Buying any Lamp before the

MON-ARC

Everything about it is of the very best. Brass Frame, Brass Shell, Brass Cap, Brass Rods. No tin or stovepipe iron. It combines unequaled simplicity with absence of all objectionable features heretofore present in alternating lamps. It is a **NON-STICKER** that central station men and lamp trimmers will be **STUCK** on because they don't have to **MONKEY** with it every few days, taking it down to clean and oil. Lamps for all systems. We guarantee every lamp. Write for prices.

THE F. P. LITTLE ELECTRICAL CONSTRUCTION AND SUPPLY COMPANY,

McDOUGALL, LUCAS & CO., Genl. Western Agents, The Pookery, Chicago. BUFFALO, N. Y.

MANUFACTURED BY
The Indiana Rubber & Insulated Wire Co.,
Office, Marion, Ind. Factory, Jonesboro, Ind.

TRADE MARK. E A A AETNA

Aetna Railway Insulators,
Anderson Line Material,

Manufactured solely by ALBERT & J. M. ANDERSON,
289 to 293 A Street, Boston, Mass.
Correspondence Solicited.

WHO SAID
"INCANDESCENT ARC LAMP?"

What's the matter with a straight incandescent lamp which for the same power consumed gives a more satisfactory illumination, and is cheaper to install and operate?

This is the Packard **MOGUL**, made by the

NEW YORK & OHIO CO., Warren, Ohio.

200, 300 and 500 candle power. 2¼ to 3 watts per candle power efficiency.

ALFRED F. MOORE,

MANUFACTURER OF

INSULATED ELECTRIC WIRE,

FLEXIBLE CORDS and CABLES.

200 and 202 North Third Street. - - PHILADELPHIA, PA.

DRY BATTERIES.

BEST OF ALL IS **THE STANDARD,**

Made by J. H. BUNNELL & CO., 76 Cortlandt St., New York.

Best Construction and Ingredients. Strongest, most Durable and Reliable. Size 6x2½, 60 cts. per cell.
LIBERAL DISCOUNTS.

AMERICAN CARBONS.

Burn them up and burn them down,

That is what they are made for. Some Carbons are not fit to burn in an arc lamp, they are more suitable for the furnace.
The American Carbon is a success. Our customers say so and keep right on using them. And the prices—you ought to know about them. Write us.

SPECIAL ANNOUNCEMENT.

"THE HELIOS"

SPECIAL ALTERNATING ARC LAMP

Can be run three in series from 105 volt secondary circuit.

STANDARD ALTERNATING ARC LAMPS

Can be run in multiple from 50 or 100 volt secondary circuits by Spencer Economy Coils.

No Special Transformers Necessary. No Dead Resistance Required. No Change of Wiring.

SPECIAL NOTICE.

Helios Carbons will be sold only with the Helios Lamp. The Helios is the only lamp that has a legal right to use the reflector plate between the standards, without which one-half of the light is wasted.

The wire has been used UNDER COVER, IS AS GOOD AS NEW, and will be sold CHEAP FOR CASH.

ADDRESS,

D. C. Spruance,

Auditorium Hotel, - CHICAGO.

Announcement.

THE BUCKEYE ELECTRIC COMPANY, Manufacturers of the high grade and favorably known "BUCKEYE" incandescent lamp, take pleasure in announcing to their friends and customers and the trade generally, that on January 23, 1894, Hon. A. J. Ricks, Judge of the United States Circuit Court, at Cleveland, Ohio, dissolved the injunction which had been previously obtained by the General Electric Company against this Company, and in so doing used the following language:

"Did the defendant in good faith act upon the complainants' limitation of the life of their patent, and was it so induced to act by the conduct of the complainants, and is it now in such relation to the complainants as estops them from denying that their conduct induced the defendant to make its investments and act as it has set forth in its motion now under consideration?

"The circumstances under which the defendant began its enterprise of manufacturing Electric Incandescent Lamps: The different stages in the progress of its development, and the reasons inducing it to increase its capital are fully set forth in its motion and as hereinbefore recited.

"Without deciding how far others not similarly situated had the right to rely upon such conduct on the part of the complainants or without passing upon the question, of how far the public generally acquired rights under the complainants' proceedings in the patent office by which they limited the life of their patent, it is sufficient to find under this motion, that the defendant by reason of the circumstances particularly set forth in its motion did rely upon the complainants' conduct, and had a right to be, and was in fact influenced thereby.

"If I am in error as to this conclusion no great harm can result to the complainants, and their right to contest as to other infringers not able to show such meritorious claims to estoppel, as this defendant has established can be asserted without prejudice from this decision."

The lamps manufactured by this Company are therefore "LAWFULLY MADE" and we guarantee the fullest protection in every respect to all purchasers or users. We are now ready to fill orders with care and promptness.

Lieut. F. B. Badt's latest addition to our famous hand-book series, of which 30,000 copies have been sold. The new book deals in the author's well-known practical style with all the problems of Electric Power Transmission.

NOW READY. PRICE $1.00.

ELECTRICIAN PUBLISHING CO., 6 Lakeside Building, CHICAGO.

Litigation! Litigation!

When the General Electric Company was formed by the absorption of the Thomson-Houston, the Edison General Electric and other companies, it inaugurated, for the express purpose of crushing out all competition, a policy of intimidation and costly litigation towards those users of electric machinery who had on account of superior quality of apparatus, preferred to purchase from competing companies. The officers of the Westinghouse Electric and Manufacturing Company were informed two years ago that an offer to join the Trust was open to them for a short period, on a certain basis of valuation, which basis was simply absurd. At that time it was intimated that if the offer was not accepted, a course would be adopted that would prevent the securing of orders, but in this latter particular the purchasers of electrical apparatus have decreed otherwise, as the events of the past two years have shown. The Trust seems to have learned but little by experience for it has just started a series of suits against users of competing apparatus and parties who have proposed to purchase from other manufacturers. The Westinghouse Electric and Manufacturing Company defends all of its customers in the following terms: "The company shall, at its own cost and expense, defend any and all suit or suits that may be instituted by any party against the purchaser for the alleged infringement of a patent or patents, when such alleged infringement shall consist in the use of any apparatus, machinery or device, or parts thereof, manufactured and sold by the company, for which the purchaser shall have made all payments then due, provided that immediate notice of the institution of such suit or suits be given in writing by the purchaser to the company, and that the purchaser shall permit the company, through its counsel, to defend the same, and shall give all needed information, assistance and authority to enable the company so to do, and thereupon, in case of an award of damages in such suit or suits the company shall pay such award. But the company shall not be bound to defend any suit or suits, nor to pay any damages therein, when the same shall arise by reason of the use of parts not furnished by the company."

STOPPER LAMPS. Were invented and patented by Sawyer and Man before the date of any of the inventions upon which the Trust now relies to secure to it a monopoly of the sale of incandescent lamps. These stopper lamps have been perfected and were used exclusively for the World's Fair lighting. Stopper lamps do not infringe the Edison patents, and they are cheaper and better than the Edison lamps.

FEEDER AND MAIN PATENT. By the use of our system of alternating current distribution and lamps, the use of the feeder and main feature of the Edison patent is not only unnecessary but leads to increased cost. All parties who are in any manner threatened with respect to this patent are advised to communicate with us immediately.

THREE WIRE PATENT. The alternating system distributing electricity renders the three wire feature an unnecessary complication. This company is prepared to furnish plans whereby better distribution of light can be had than is possible with the continuous current system and one hundred 110 volt lamps which are necessary with it.

"Purchase apparatus and repairs at Fair prices." It has recently been announced that the General Electric Company enjoys a trade of about four millions of dollars per annum for repairs, which it is claimed cannot be interfered with. This is certainly a monstrous sum of money to be paid out by the electric fraternity for repairs. We invite correspondence from any company which is paying anything toward these four millions, with a view of putting them in a position to get their repairs and renewals at reasonable rates, or what is still better, to get apparatus which will not require such enormous amount for repairs. We would also invite correspondence from all companies who are laboring under the onerous obligations of the famous contract form "D." We can help them also.

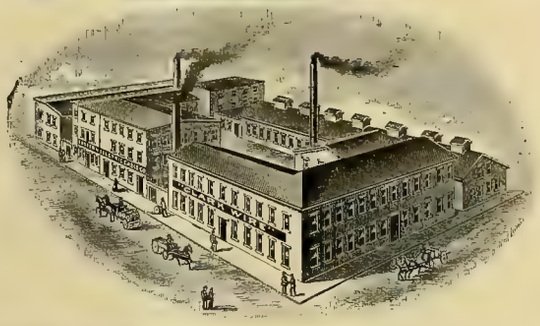
"CLARK" WIRE.

TRADE MARK

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

Siemens & Halske Electric Company of America,

Siemens & Halske: Berlin, Charlottenburg, Vienna, St. Petersburg.

MANUFACTURERS OF

DIRECT CURRENT MULTIPOLAR DYNAMOS AND GENERATORS.

These machines are constructed with outside revolving armatures, without and with special commutator, as desired. They have proved remarkably efficient and economical. Used largely in European Central Stations. They are slow-speed machines, made for direct connection to engine without belting, and in sizes from 20 H. P. to 1,500 H. P.

HIGH-SPEED BELTED SIEMENS DYNAMOS

Are copied extensively in this country as "Drum Type." We are building these machines in size from 1 H. P. to 150 H. P.

ALTERNATING AND MULTIPHASE CURRENT DYNAMOS

With laminated field and armature, in sizes from 1 H. P. to 4,000 H. P., for belted or direct coupling.

MOTORS

Of every speed for direct, alternating or multiphase current, in sizes from 1-10 H. P. up to 4,000 H.P. Durable and economical in operation.

SIEMENS BAND LAMPS

For direct and alternating current, for constant potential and series machines.

SIEMENS ARC LIGHT CARBONS

With either solid or soft cores, which are the most economical in the world and give a steady light.

ALL INSTRUMENTS

Requisite for the regulation of electric apparatus; also the Siemens Voltmeters and Ammeters and Automatic devices made in Berlin.

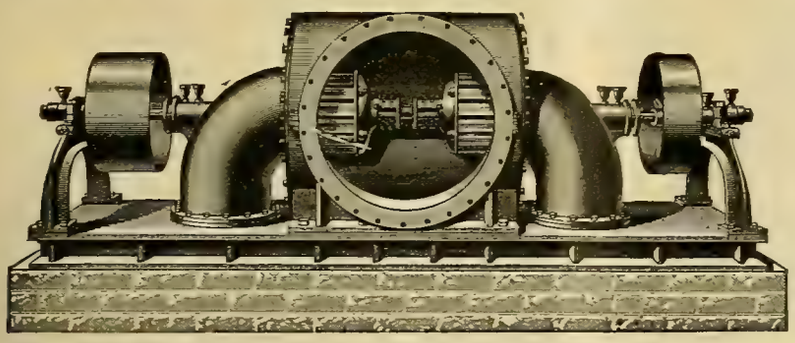
MIAMISBURG ELECTRIC CO., MIAMISBURG, OHIO.

Manufacturers of Burnley's Cartridge Batteries, Imperial Dry Batteries, Commutator Segments, Commutators, Brush Copper, Brushes, Etc.

TEMPERED COPPER.

VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high Speed and great Efficiency**, and **large Capacity** for its **diameter**, being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

SEND FOR CATALOGUE AND PARTICULARS.

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of 12 inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast-Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage**, and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

CONTENTS.

PART I.—Polyphase Currents.

CHAPTER 1....Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3 ...The Tesla Rotating Magnetic Field.—Motors with Closed Conductors. —Synchronizing Motors.—Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture. On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31....."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

PART III.—Miscellaneous Inventions and Writings.

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by

DIVIDENDS!

The **ANNUAL REPORT** of your plant, soon due, may suggest additions or betterments for the purpose of earning a larger dividend for the year 1894.

Perhaps you have not earned a dividend.

In this case there is **A CAUSE.**

See to it that your station is equipped with modern machinery—apparatus known to be EFFICIENT, DURABLE, and SIMPLE.

Avoid the Ruts by Taking to the Fields.

CAUTION.

There never was a better time than the present to procure new and second-hand machinery and material.

The conglomeration left on the market as a result of the World's Fair contains many bargains for shrewd buyers who refrained from wasting time and money on the Midway, and as a consequence are now prepared to pay as well as buy.

The list includes new and second-hand dynamos, power motors, fan motors, exhaust fans, bells, batteries, annunciators, burglar alarms, and in fact almost everything that a well organized but almost "busted" electrical community can convert into cash.

You can get along easier by taking to these fields.

Correspondence solicited.

Important to Lighting Stations!

OUR NEW:

ALTERNATING CURRENT INDICATORS

Are now ready. Before purchasing elsewhere send for our Supplementary Catalogue which contains the prices and description of the above instruments, and also a list and prices of other *new instruments* of our manufacture.

Whitney Electrical Instrument Company,

146 Franklin Street, BOSTON, MASS.

Penacook, N. H., U. S. A.—FACTORIES:—Sherbrooke, P. Q., Canada.

AGENTS:

Chicago, Ill., Electric Appliance Co.
Cincinnati, Ohio, Nowotny Electric Co.
Halifax, N. S., John Starr Son & Co., Ltd.
Lynchburg, Va., The Poole Electric Co.
Montreal, P. Q., T. W. Ness & Co.
New York City, Geo. L. Colgate, 136 Liberty St.
San Francisco, Cal., California Electrical Works
Toronto, Ont., Toronto Electrical Works.

ELECTRIC TELEPHONES.

We are prepared to furnish first-class telephone receivers in quantities at very low prices.

Our complete outfit, including transmitter, receiver and signaling apparatus, will be ready for delivery after February 15th. These outfits will have an automatic circuit-changing device, which we guarantee is no infringement.

We are headquarters for telephone receiver shells, permanent bar magnets, magneto bells, line material, etc.

THE MESCO DRY BATTERY

is recommended for telephone transmitter and all other open circuit work. **Over 200,000 in use. PRICES REDUCED,** making it the cheapest reliable open circuit battery on earth.

GET OUR PRICES on Leclanche batteries, zincs, Manhattan door opener (no push-out spring required), watchman's clocks (just out). Special low prices on speaking tubes, whistles, bronze push buttons and annunciators. We have a **Job lot** of spun, bronze and nickel plated push buttons.

If you will send us your address we will get some of your trade.

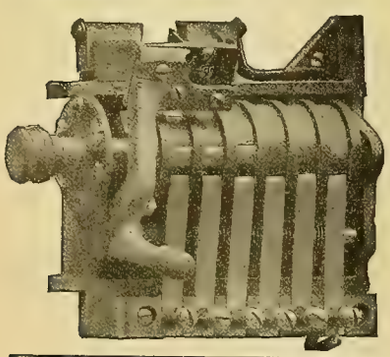
Manhattan Electrical Supply Co.,

36 Cortlandt St., NEW YORK.

Consolidated Car-Heating Co.,

Chicago, Ill. ALBANY, N. Y. Coatecook, P. Q.

COMFORT. **SAFETY.**



Electric Car-Heating.

Regulating Switch Gives

FIVE DIFFERENT INTENSITIES OF HEAT.

In Practical Operation in More Than 25 Leading Cities in U. S. and Canada.

SPECIAL ANNOUNCEMENT.

"THE HELIOS"

SPECIAL ALTERNATING ARC LAMP

Can be run three in series from 105 volt secondary circuit.

STANDARD ALTERNATING ARC LAMPS

Can be run in multiple from 50 or 100 volt secondary circuits by Spencer Economy Coils.

No Special Transformers Necessary. No Dead Resistance Required. No Change of Wiring.

SPECIAL NOTICE.

Helios Carbons will be sold only with the Helios Lamp. The Helios is the only lamp that has a legal right to use the reflector plate between the standards, without which one-half of the light is wasted.

HELIOS ELECTRIC CO., 1310 Filbert St., Philadelphia.

DAYS IN FEBRUARY

When you Should Send Us Your Order For

ALL ELECTRICAL SUPPLIES.

Send for Catalogue if you have not one already.

WONDERFUL

Is the only word which will convey anything like an adequate idea of the

New Magneto Telephone

Now offered to the Public by the

Western Telephone Construction Co.

While others laud "Magnetophones," we desire to state positively that our New Magneto Telephone is the

Best Telephone in the World.

This instrument appears to talk equally well through one mile or one thousand miles of wire. The experiments just made between Chicago and telephones in Chicago; between Chicago and telephones in Milwaukee, Wis.; and

Between Chicago and Telephones in New York,

With this new telephone were a grand success. Those who talked through the long lines state positively that they could not distinguish a difference in the voice, volume or clearness over long or short lines.

This new Telephone will undoubtedly startle the electrical fraternity for

Two Reasons:

FIRST, It is a more efficient telephone instrument than the present long-distance telephone;

SECOND, It will be sold outright at as low a price as the ordinary standard type of telephones generally offered.

There is absolutely

No Infringement

Of patents not owned or controlled by this company.

As from 150 to 200 requests a day for sample, or trial telephones, have been made upon this company, it has been found necessary to adopt the

Following Rule:

We will ship a pair of these instruments for trial to any address on receipt of price, and at the end of 30 days, if the purchaser desires to return the same, he may do so on payment of the packing and express or freight charges, and we will refund the money paid for them.

Magneto Telephones, same as Bell Telephones, $2.00 each.

WESTERN TELEPHONE CONSTRUCTION COMPANY,

440 Monadnock Bldg., Chicago, Ill., U. S. A.

BUCKEYE.

THE BUCKEYE ELECTRIC COMPANY, Manufacturers of the high grade and favorably known "BUCKEYE" incandescent lamp, take pleasure in announcing to their friends and customers and the trade generally, that on January 23, 1894, Hon. A. J. Ricks, Judge of the United States Circuit Court, at Cleveland, Ohio, dissolved the injunction which had been previously obtained by the General Electric Company against this Company, and in so doing used the following language:

"Did the defendant in good faith act upon the complainants' limitation of the life of their patent, and was it so induced to act by the conduct of the complainants, and is it now in such relation to the complainants as estops them from denying that their conduct induced the defendant to make its investments and act as it has set forth in its motion now under consideration?

"The circumstances under which the defendant began its enterprise of manufacturing Electric Incandescent Lamps: The different stages in the progress of its development, and the reasons inducing it to increase its capital are fully set forth in its motion and as hereinbefore recited.

"Without deciding how far others not similarly situated had the right to rely upon such conduct on the part of the complainants or without passing upon the question, of how far the public generally acquired rights under the complainants' proceedings in the patent office by which they limited the life of their patent, it is sufficient to find under this motion, that the defendant by reason of the circumstances particularly set forth in its motion did rely upon the complainants' conduct, and had a right to be, and was in fact influenced thereby.

"If I am in error as to this conclusion no great harm can result to the complainants, and their right to contest as to other infringers not able to show such meritorious claims to estoppel, as this defendant has established can be asserted without prejudice from this decision."

The lamps manufactured by this Company are therefore "LAWFULLY MADE" and we guarantee the fullest protection in every respect to all purchasers or users. We are now ready to fill orders with care and promptness.

THE

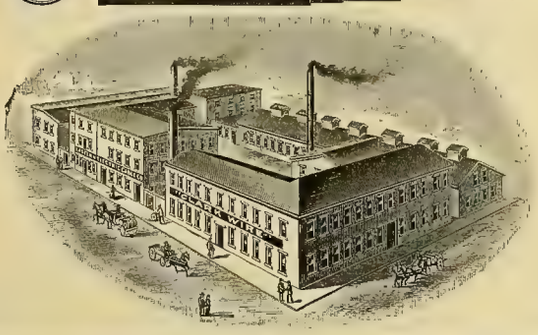
"CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

CONTENTS.

PART I.—Polyphase Currents.

CHAPTER 1....Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors.—Synchronizing Motors.—Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31....."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

PART III.—Miscellaneous Inventions and Writings.

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by

JUST OUT!

MODERN AMERICAN METHODS OF COPPER SMELTING,

—BY—

Edward Dyer Peters, Jr., M. E., M. D.

SECOND EDITION, REVISED AND ENLARGED.

Price, Postage Prepaid, $4.00.

THE MOST COMPLETE WORK OF ITS KIND PUBLISHED.

Electrician Publishing Co.,

6 Lakeside Bldg. - - - CHICAGO, ILL.

STANDARD ELECTRICAL DICTIONARY.

By T. O'CONOR SLOANE, A. M., E. M., Ph. D.

624 Pages. 350 Illustrations. Price $3.00

A popular dictionary of words and terms used in the practice of electricity.

A concise and practical book of reference for the expert as well as the beginner.

Any subject can be found, treated in all its aspects.

As important to electrical artisans as Webster's.

No one interested in electricity should be without it.

Sent, Postage Prepaid, on Receipt of Price.

A NEW BOOK!

NOW READY.

New Dynamo Tenders' Hand-Book.

226 Pages. 138 Engravings. Hand-Book Size.

Lieut. F. B. Badt's latest addition to our famous hand-book series, of which 30,000 copies have been sold. The new book contains more than twice as many pages and twice as many engravings as were comprised in the old, and will continue to retain the distinction of being the ONLY STANDARD WORK for the practical dynamo man and the learner.

NOW READY. **PRICE, $1.00.**

Electrician Publishing Co.,

6 LAKESIDE BIULDING, CHICAGO.

ELECTRICITY FOR ENGINEERS.

Part I, 268 Pages, $2.00. **Part II, 156 Pages, $1.00.**

WHEN ORDERED TOGETHER PRICE IS $2.50.

Both Works Profusely Illustrated.

☛ **Just the Work for Engineers, Electricians, Dynamo Tenders, etc.**

PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current — How Produced — Induction — Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting—Testing—Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel—Multiple Series — Multiple Series Cut-Out — Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators — Brushes — Different Styles of Brushes — Double Brushes—Single Brushes — Troubles with Commutators and Brushes — Correct Position of Brushes—Sparking at Brushes — Care of Brushes and Commutators — Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation — Dynamo — Extra Brush — Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers — Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from those used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation — Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

ARE YOU LOOKING FOR AN

ALTERNATING CURRENT LAMP

That is **Simple and effective,**
Strong and durable,
Not liable to get out of order,
Positive in action,
Complete in all details,
Practically noiseless,
Thoroughly waterproof,
Without the use of a hood,
Moderate in price?

If you are, write us.

The WASHINGTON ALTERNATING ARC LAMP

Will fill the bill in every particular.

WASHINGTON ELECTRIC CO.,

197 and 199 South Canal Street, CHICAGO.

Our Individual Arc Light and Motor Cut-Outs

ARE

RELIABLE,

ECONOMICAL,

SIMPLE,

And Require Only One Small Wire.

ELECTRIC SELECTOR & SIGNAL CO.

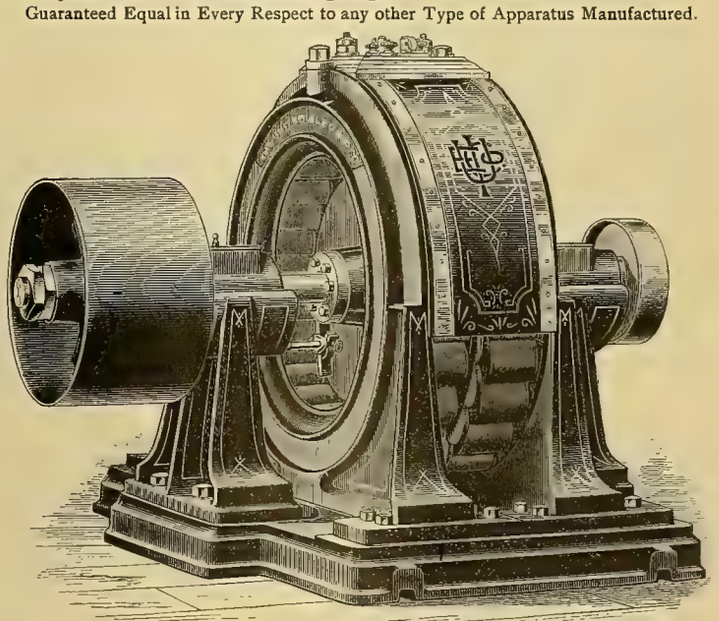
(Successor to ELECTRIC SECRET SERVICE CO.,)

45 Broadway, NEW YORK.

Alternating Current Generators,

For Central Station Equipment.

Adapted for Arc and Incandescent Lighting.
Guaranteed Equal in Every Respect to any other Type of Apparatus Manufactured.



Slow Speed and Close Regulation. Standard of Simplicity and Durability.

ALSO

Direct Current Apparatus for Lighting Factories, Public Buildings and Isolated Plants.
Improved Long Distance Series Incandescent Apparatus for Street and Commercial Illumination.
Incandescent Lamps and Sockets for use on Arc Light Circuits,

Correspondence Solicited.

ELECTRIC TELEPHONES.

We are prepared to furnish first-class telephone receivers in quantities at very low prices.

Our complete outfit, including transmitter, receiver and signaling apparatus, will be ready for delivery after February 15th. These outfits will have an automatic circuit-changing device, which we guarantee is no infringement.

We are headquarters for telephone receiver shells, permanent bar magnets, magneto bells, line material, etc.

THE MESCO DRY BATTERY

is recommended for telephone transmitter and all other open circuit work. **Over 200,000 in use. PRICES REDUCED,** making it the cheapest reliable open circuit battery on earth.

GET OUR PRICES on Leclanche batteries, zincs, Manhattan door opener (no push-out spring required), watchman's clocks (just out). Special low prices on speaking tubes, whistles, bronze push buttons and annunciators. We have a **Job lot** of spun, bronze and nickel plated push buttons.

If you will send us your address we will get some of your trade.

SPECIAL ANNOUNCEMENT.

"THE HELIOS"

SPECIAL ALTERNATING ARC LAMP

Can be run three in series from 105 volt secondary circuit.

STANDARD ALTERNATING ARC LAMPS

Can be run in multiple from 50 or 100 volt secondary circuits by Spencer Economy Coils.

No Special Transformers Necessary. No Dead Resistance Required. No Change of Wiring.

SPECIAL NOTICE.

Helios Carbons will be sold only with the Helios Lamp. The Helios is the only lamp that has a legal right to use the reflector plate between the standards, without which one-half of the light is wasted.

ANNOUNCEMENT.

The Mather Electric COMPANY.

THE MATHER ELECTRIC COMPANY, manufacturers of the well-known Mather Electrical apparatus, take pleasure in announcing to their friends and customers, and the public in general, that it has been entirely reorganized, the management now being in the hands of well-known and experienced men in the Electrical Field, and the Company is at once prepared to actively engage in the manufacture and sale of Dynamos, Motors and Generators for Electric Lighting, Power and Railway Systems.

THE MATHER ELECTRIC COMPANY has discontinued its General Selling Office, at Boston, and will hereafter transact all business directly from its main office at MANCHESTER, CONN., to which place all communications should be addressed to receive immediate attention.

THE MATHER ELECTRIC COMPANY has recently completed an extension of its plant in the form of an erecting shop, 200x50 feet, fitted with Traveling Crane and heavy machinery, and is prepared to expeditiously handle Generators varying in size from the smallest up to 500 kilowatts in capacity.

THE MATHER ELECTRIC COMPANY will hereafter appoint no agents, and the sale of its apparatus will be made direct to its customers or through contractors of undoubted reliability and financial standing throughout the various sections of the country, thus giving purchasers the benefit of a great saving and expense otherwise incurred in connection with the district offices, etc.

ELECTRICAL TRUSTS AND COMBINATIONS.

THE MATHER ELECTRIC COMPANY deems it necessary, in view of the already formed combinations in the electrical business, to state that it is entirely independent of any and all such combinations.

THE MATHER SYSTEM of Incandescent Lighting and Transmission of Power is owned and controlled absolutely by The Mather Electric Company, and the business of manufacturing and installing the Mather apparatus will, in the future as in the past, be conducted without reference to, or association with, any other company.

THE MATHER ELECTRIC COMPANY believes that there is room in this country for an independent company, manufacturing and selling its apparatus on the basis of merit, and expecting a reasonable profit on capital actually invested; to that class of customers who appreciate independence and the advantages of fair competition, The Mather Electric Company especially addresses this announcement, assuring them that this Company always has been in control of its own business, is now in control, and proposes to remain so in the future. The Mather Electric Company is not for sale now or in the future. All statements to the contrary, from whatsoever source, are false.

Correspondence solicited from parties and individuals contemplating a purchasing or installation of electrical apparatus of any nature whatsoever.

THE

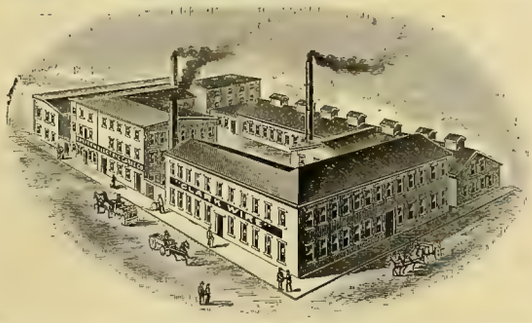
"CLARK" WIRE.

TRADE MARK

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage,** and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

CONTENTS.

PART I.—Polyphase Currents.

CHAPTER 1....Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors.—Synchronizing Motors.—Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31...."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

PART III.—Miscellaneous Inventions and Writings.

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by

Dictionary of Electrical Words, Terms and Phrases.

By EDWIN J. HOUSTON, A. M.

562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.

This Dictionary includes 5,000 **distinct Words, Terms and Phrases**. Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

The Scheme of Treatment is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

A NEW BOOK!

NOW READY.

New Dynamo Tenders' Hand-Book.

226 Pages. 138 Engravings. Hand-Book Size.

Lieut. F. B. Badt's latest addition to our famous hand-book series, of which 30,000 copies have been sold. The new book contains more than twice as many pages and twice as many engravings as were comprised in the old, and will continue to retain the distinction of being the ONLY STANDARD WORK for the practical dynamo man and the learner.

NOW READY. PRICE, $1.00.

Electrician Publishing Co.,

6 LAKESIDE BIULDING, CHICAGO.

ELECTRICITY FOR ENGINEERS.

Part I, 268 Pages, $2.00. Part II, 156 Pages, $1.00.

WHEN ORDERED TOGETHER PRICE IS $2.50.

Both Works Profusely Illustrated.

☛ **Just the Work for Engineers, Electricians, Dynamo Tenders, etc.**

PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current — How Produced — Induction — Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting—Testing—Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel—Multiple Series — Multiple Series Cut-Out — Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators — Brushes — Different Styles of Brushes — Double Brushes—Single Brushes — Troubles with Commutators and Brushes — Correct Position of Brushes—Sparking at Brushes — Care of Brushes and Commutators — Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation — Dynamo — Extra Brush — Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from those used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation — Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

Orders Promptly Filled on Receipt of Price. Postage Prepaid.

Our High Grade *American*

INCANDESCENT LAMPS.

QUALITY UNEXCELLED.

QUALITY UNEQUALED.

American Electrical Mfg. Co. 2011 to 2017 Pine Street, ST. LOUIS, MO.

Metal-Sheathed Bushings,

Made especially to conform to the requirements of the Underwriters' Regulations.

We take pleasure in presenting to the Trade an *armored bushing* made to comply with Underwriters' Requirements.

It is thoroughly "*water-proof,*" "*non-combustible*" and has superior insulating qualities: The Armor gives strength and durability, which neither Glass, Porcelain nor Vulcanized Rubber possess.

It has a small external diameter, and requires a much smaller hole than Glass, Porcelain or Hard Rubber. The large head prevents breaking or splitting and the smooth brass armor makes the bushing easily driven into position.

PRICE LIST PER 100 PIECES.

LENGTH OVER ALL IN INCHES.	1½	2½	3	4	6	8	10	12	14	16	18
5/16-inch inside diam., 1/2-inch outside diam.,	$2 70	$2 90	$3 00	$3 20	$5 30	$6 05	$6 90	$7 70	$8 65	$9 25

Any length made to order at proportionate prices.

Underwriters' Requirements.

RULE 18. CONDUCTORS:—Amend Section (*b*) to read as follows:—

***b*. Must be protected when passing through FLOORS; or through walls, partitions, timbers, etc., in places liable to be exposed to dampness, by water-proof, non-combustible, insulating tubes, such as glass or porcelain.**

Must be protected when passing through walls, partitions, timbers, etc., in places not liable to be exposed to dampness by *approved insulating bushings* specially made for the purpose.

RULE 18. CONDUCTORS:—

Section *b*. Second paragraph. Except for FLOORS, *and* for places liable to be exposed to dampness, Glass, Porcelain, *metal-sheathed Interior Conduit,* and Vulca Tube, when made especially for bushings, will be *approved. The two last named will not be approved if cut from the usual lengths of tube made for conduit work, nor when made without a head or flange on one end.*

Knoxville, St. Louis,
Cincinnati, Pittsburg, Mobile.

HOOD & OSBURN, 239 La Salle Street, CHICAGO.

OWEN FORD, Rialto Building, ST. LOUIS, MO.

If you are contemplating the purchase of Alternating Apparatus, get

TWO-PHASE GENERATORS

which will cost no more than single phase. You can then operate lights as economically and as satisfactorily as from single phase generators, and in addition use

ALTERNATING CURRENT MOTORS,

which we are now building in 1, 2, 3, 5, 7, 10 and 15 Horse Power sizes. Our standard

TRANSFORMERS

For lighting purposes are carried in stock, and orders can be filled promptly.

The most economical and easiest handled transformer on the market. Special transformers for any desired voltage. Special transformers for arc lighting.

STANLEY ELECTRIC MFG. CO.,

PITTSFIELD, MASS.

Selling Agents for the Helios Arc Lamps in New England and New York State.

Western Office, 102 Michigan Avenue, CHICAGO, ILL.

THE HOWARD SYSTEM.

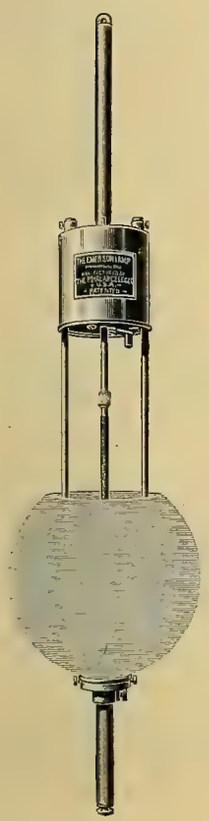
"THE NEW INCANDESCENT ARC LIGHT."

PERFECT DISTRIBUTION OF LIGHT.

FOR ALL CIRCUITS.

COST OF TRIMMING REDUCED TO A MINIMUM.

APPURTENANCES CAN BE ATTACHED TO ANY MAKE OF ARC LAMP.

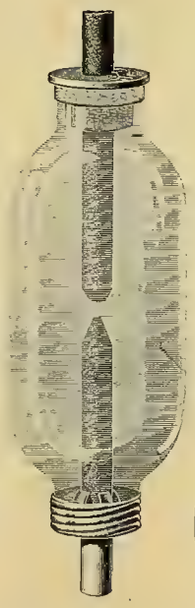


"The importance to the future of the electric lighting industry cannot be over-estimated." *The Electrical Engineer, New York.*

"The most efficient spark arrester presented."
C. M. GODDARD, Sec.,
International Underwriters' Ass'n.

"The best spark arrester that can be devised."
F. E. CABOT, Supt.,
Boston Board of Fire Und.

"Unqualified approval as a spark arrester."
C. M. GODDARD,
Treas.,
N. E. Ins. Exchange.



"A complete fire protector and practical apparatus."
A. C. DUNHAM,
Pres.,
Hartford Elec. Lt. Co.

Life of one pair of $\frac{7}{16}$ inch carbons over 100 hours.

This system has been introduced in the City of Hartford, Conn. by the Connecticut Royal Arc Co., and has been in continuous operation on street and commercial circuits for the past five months. Merchants in the City of Hartford employing Arc Lights by adopting this appurtenance have been able to save 33⅓ per cent. from established rates made by the Hartford Board of Fire Underwriters.

The commercial advantages enjoyed when this equipment is adopted are many: Cleanliness, removal of anxiety in regard to fire and the necessity for trimming the lamp reduced to twelve times per year, where average lamp hours are employed.

THE ROYAL ARC ELECTRIC CO., U. S. A. 143 Liberty St., New York.

Direct Current Arc Lighting!

THE LOWEST PRICES!
THE BEST APPARATUS!

THE GENERATOR is of the same excellence of electrical design and mechanical construction as all of our standard apparatus. It produces CONSTANT CONTINUOUS CURRENT, is *Absolutely Automatic in Regulation*, without extra devices, and is the MOST EFFICIENT GENERATOR ever offered. The ARMATURE COILS are MACHINE WOUND and of the HIGHEST GRADE OF INSULATION.

SIZES: 25, 40, 60, 100 Lamps' Capacity.

THE ARC LAMPS for use with these machines are of superior design, neat in appearance, simple and durable mechanism.

PRICES:

LAMPS' CAPACITY:	PRICE:
25	$1,250.00
40	1,600.00
60	2,100.00

These Prices Include Generator, Lamps and Switchboard Instruments.

LAMPS SOLD SEPARATELY, $17.50 EACH.

Generators and lamps will operate on existing circuits.

We invite correspondence.

Westinghouse Electric & Manufacturing Co.,

Pittsburgh, Pa.

Important to Lighting Stations!

OUR NEW:

ALTERNATING CURRENT INDICATORS

Are now ready. Before purchasing elsewhere send for our Supplementary Catalogue which contains the prices and description of the above instruments, and also a list and prices of other ***new instruments*** of our manufacture.

THE

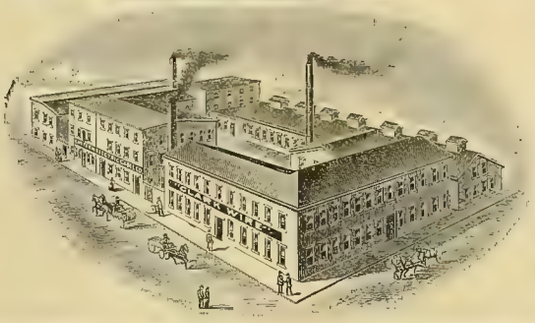
"CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Wes'ern Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

CONTENTS.

PART I.—Polyphase Currents.

CHAPTER 1....Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors.—Synchronizing Motors.—Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31....."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

PART III.—Miscellaneous Inventions and Writings.

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by

Cuyahoga Falls, Ohio.

Manufacturers of

Friction Clutches, Shafting, Etc.

Special attention given to the Complete Equipment of Electric Plants.

BRANCH OFFICES:

8 South Canal St., CHICAGO.

39 Cortlandt St., NEW YORK.

Directory of Principal Electrical and Mechanical Engineers.

B. J. Arnold, Mem. A. I. E. E.,
Consulting Electrical Engineer,
Specialty: Electric Railways and Power Stations.
565 Rookery, Chicago.

Chas. G. Armstrong,
Expert and
Electrical Engineer,
Auditorium Tower, Chicago.

O. M. Stone,
Electrician,
Good work, square work, perfect work; just such work as our customers want. Fine house work and repairs a specialty. Private lines built complete.
260 S. Clark St., Chicago.

William D. Ball, B. S. (E. E.)
Consulting Engineer,
Room 110, 115 Dearborn St., Chicago.
Telephone Main 1584.

N. S. Amstutz,
Mechanical and Electrical Engineer,
New Electrical Devices Perfected for Shop Construction.
Tests, Plans, Estimates, Supervision and Expert Opinions.
506 The Cuyahoga, Cleveland, O.

Frederick L. Merrill,
Electrical Engineer,
Specialty: Storage Battery Work.
304 Rookery, Chicago

Gustave Monrath, C. P., I. E.
Electrical Engineer,
Contractor for Electric Light and Electric Power Transmissions.
1417-1419 Monadnock Building, Chicago.

Harry G. Osburn,
Electrical Engineer,
239 La Salle Street, Chicago.
Telephone, Harrison 306.
Estimates and Specifications prepared.
Special Attention Given to the Supervision of Electrical Work.

LOUIS K. COMSTOCK,
Consulting and Constructing
Electrical Engineer,
1437-38 Monadnock Blk., Chicago.

Wm. H. Bryan, M. Am. Soc. M. E.
Mechanical and Electrical Engineers.
Consultations, Reports, Estimates, Plans, Specifications, Superintendence, Tests, Purchasing.
Turner Building, St. Louis.

PATENTS.—Twenty years' experience. Send model or sketch and brief description of your invention for report as to patentability. Expert searches and opinions. Patent causes prosecuted and defended. Practice in U. S. Supreme, Circuit and Circuit Appeals Courts, and U. S. Patent Office. Send for "Plain Words about Patents," free. Patent practice exclusively.
E. B. STOCKING, Attorney at Law, 611 F St., N.W., **Washington, D. C.**

A NEW BOOK!

NOW READY.

New Dynamo Tenders' Hand-Book.

226 Pages. 138 Engravings. Hand-Book Size.

Lieut. F. B. Badt's latest addition to our famous hand-book series, of which 30,000 copies have been sold. The new book contains more than twice as many pages and twice as many engravings as were comprised in the old, and will continue to retain the distinction of being the ONLY STANDARD WORK for the practical dynamo man and the learner.

NOW READY. PRICE, $1.00.

Electrician Publishing Co.,

6 LAKESIDE BIULDING, CHICAGO.

YOU NEED THESE BOOKS.

NEW DYNAMO TENDERS' HAND-BOOK.

By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. 138 Engravings.

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.

By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.

By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.

By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS.

"TRAMS."

Their Construction, Operation and Maintenance.

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. Profusely Illustrated.

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.

By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY ... OF ... ELECTRICAL WORDS,

TERMS AND PHRASES.

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. 750 Illustrations.

PRICE, $5.00.

THE ELECTRIC MOTOR AND ITS APPLICATIONS.

By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT OF DYNAMOS AND MOTORS.

By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS FOR THE USE OF Engineers and Architects.

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. Profusely Illustrated.

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.

Experiments with Alternate Currents.

By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

SOUTHERN ELECTRICAL SUPPLY CO., ST. LOUIS.

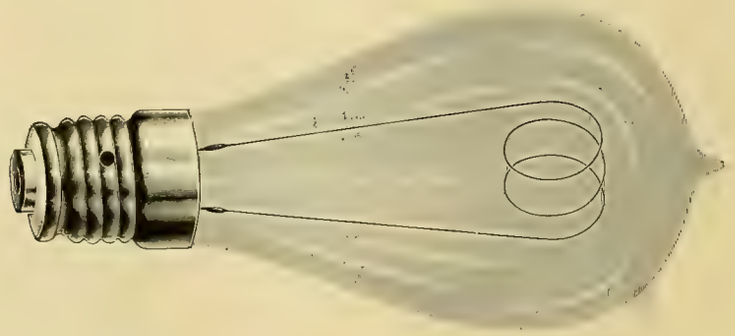
The powers of man have not been exhausted. Nothing has been done by him that cannot be better done.

There is no effort of science or art that may not be exceeded.

What the productive genius of the 20th century may evolve in the way of an Incandescent lamp we know not

TO-DAY.

THE Buckeye LAMP



Yes, we HAVE reduced our prices, but NOT at the expense of QUALITY.

We manufacture but ONE, THAT A HIGH GRADE lamp. Our prices are as LOW as those named for CHEAPLY CONSTRUCTED lamps which in quality are "so middling, BAD were better." Product of this kind is a LUXURY we cannot afford.

Shipments are being made from CHICAGO STOCK.

"Special Coiled Filament."

"Individuality and Beauty of Illumination."

"Pure WHITE Light."

"Absence of Bulb Discoloration."

"Satisfactory Length of Life."

"Low COST of Operation."

"Prompt Shipment."

"FACTORY Prices to ALL."

These are SOME of our BUSINESS BRINGERS.

Is ACKNOWLEDGED to be the BEST that genius, skill and capital has yet produced.

Of COURSE you have heard that the injunction against this company was dissolved WITHOUT BOND. Our patrons therefore have nothing to fear from SUITS or THREATS on account of infringement.

THE "MORRIN" CLIMAX STEAM GENERATOR

Has been acknowledged by all practical minds, the Best Boiler Invented.

A TESTIMONIAL.

FROM THE LABORATORY OF THOMAS A. EDISON.

ORANGE, N. J., February 6, 1894.

CLONBROCK STEAM BOILER WORKS, Brooklyn, N. Y.

Dear Sirs:—Your letter of 30th ultimo is received. I have a Climax Boiler, and it is giving great satisfaction. Taking everything in consideration, it is, in my opinion, practically and theoretically, the best boiler so far invented. Yours truly,

THOS. A. EDISON.

Hartford Elec. Lt. Co.

Life of one pair of 7/16 inch carbons over 100 hours

This system has been introduced in the City of Hartford, Conn. by the Connecticut Royal Arc Co., and has been in continuous operation on street and commercial circuits for the past five months. Merchants in the City of Hartford employing Arc Lights by adopting this appurtenance have been able to save 33⅓ per cent. from established rates made by the Hartford Board of Fire Underwriters.

The commercial advantages enjoyed when this equipment is adopted are many: Cleanliness, removal of anxiety in regard to fire and the necessity for trimming the lamp reduced to twelve times per year, where average lamp hours are employed.

W. R. Brixey Esq.
Manufacturer of Kerite
Insulated Wires & Cables
203 Broadway. New York. N. Y.

Dear Sir,

Replying to your enquiries.

I beg to state that it is now over two years since we ordered from your firm the 6000 feet of 18 Conductor Aerial Kerite Cable, for use in the Tunnel under the St. Clair River, between Sarnia Ont. and Port Huron Mich.

We have pleasure in stating that during the whole of this time, although the Cable has been continually subjected to the severe test of steam &c, it has given perfect satisfaction.

Yours truly,

Treasurer and
Sup't of Supplies.

Kerite Insulated Wires and Cables

Received the only award at the World's Fair for "High Insulation, Excellence of Material, Durability and Reliability under the Most Exacting Conditions." Over 300 miles of 8-conductor ***Kerite*** Aerial Cable constructed for and now in use on the New York Central and Hudson River Railroad Co. ***The Longest Length of this class of Cable ever put in use.***

THE

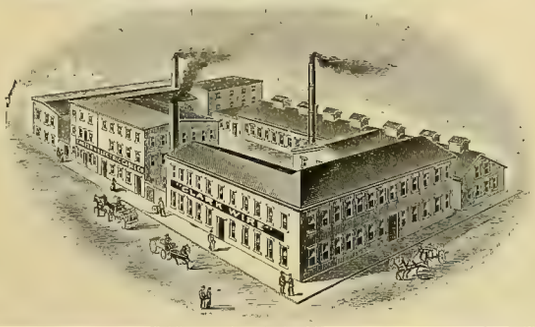
"CLARK" WIRE.

TRADE MARK

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial. Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

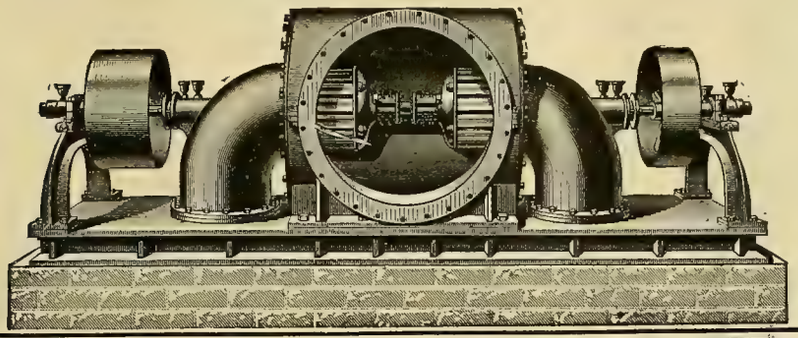
VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high Speed and great Efficiency,** and **large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

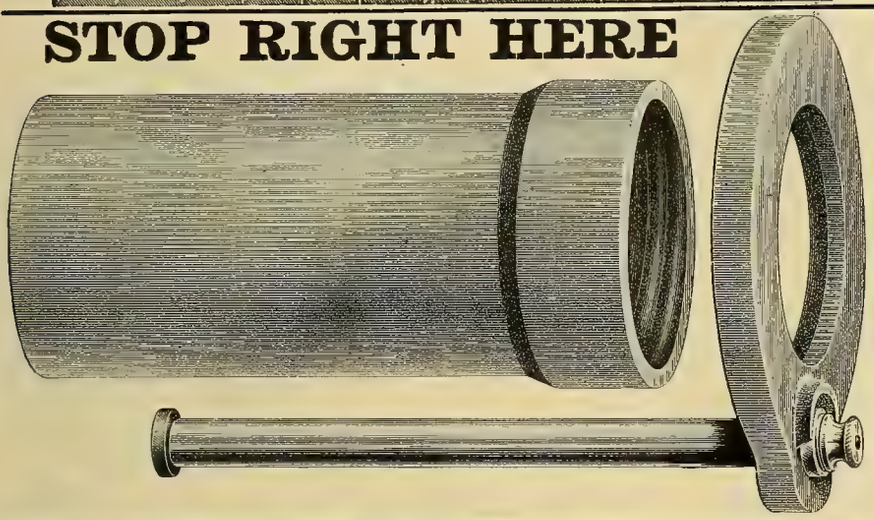
SEND FOR CATALOGUE AND PARTICULARS.

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

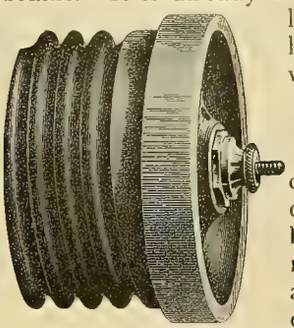
The accompanying engraving represents a pair of 12 inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast-Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

STILWELL & BIERCE MFG. CO., DAYTON, OHIO.

STOP RIGHT HERE



And take a look at the latest emanation from our brains. It is already well known throughout the land, but you may not have heard of it; therefore, we would say it is



THE LAW CARBON POROUS CUP CELL.

The illustration shows the carbon porous cup of the cell, with its removable carbon cover, which allows the removal of the depolarizing agent whenever it has become exhausted or deteriorated through over work. It also shows the jar cover carrying the zinc rod. Further comment is unnecessary. You will readily see that we have a good thing.

THE McCORMICK TURBINE,

On Vertical or Horizontal Shaft, Especially Adapted for Electric Work.

Gives more power as to diameter with a higher percentage of useful effect than any other water-wheel heretofore made. All sizes, right and left hand, are built from patterns perfected under systematic tests in the Holyoke Testing Flume.

Parties having power plants which are unsatisfactory, and those contemplating the improvement of powers, will find it to their interest to confer with me, as I am willing to guarantee results where others have failed, no matter what make of turbine has been in use. State requirements and send for catalogue.

JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage,** and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

Southern Electric Mfg. and Supply Co., Baronne Street, New Orleans, La.

WONDERFUL

Is the only word which will convey anything like an adequate idea of the

New Magneto Telephone

Now offered to the Public by the

Western Telephone Construction Co.

While others laud "Magnetophones," we desire to state positively that our New Magneto Telephone is the

Best Telephone in the World.

This instrument appears to talk equally well through one mile or one thousand miles of wire. The experiments just made between Chicago and telephones in Chicago; between Chicago and telephones in Milwaukee, Wis.; and

Between Chicago and Telephones in New York,

With this new telephone were a grand success. Those who talked through the long lines state positively that they could not distinguish a difference in the voice, volume or clearness over long or short lines.

This new Telephone will undoubtedly startle the electrical fraternity for

Two Reasons:

FIRST, It is a more efficient telephone instrument than the present long-distance telephone;

SECOND, It will be sold outright at as low a price as the ordinary standard type of telephones generally offered.

There is absolutely

No Infringement

Of patents not owned or controlled by this company.

As from 150 to 200 requests a day for sample, or trial telephones, have been made upon this company, it has been found necessary to adopt the

Following Rule:

We will ship a pair of these instruments for trial to any address on receipt of price, and at the end of 30 days, if the purchaser desires to return the same, he may do so on payment of the packing and express or freight charges, and we will refund the money paid for them.

WESTERN TELEPHONE CONSTRUCTION COMPANY,

440 Monadnock Bldg., Chicago, Ill., U. S. A.

YOU NEED THESE BOOKS.

NEW DYNAMO TENDERS' HAND-BOOK.

By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. 138 Engravings.

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.

By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.

By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.

By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS. "TRAMS."

Their Construction, Operation and Maintenance.

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. Profusely Illustrated.

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.

By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY ... OF ... ELECTRICAL WORDS, TERMS AND PHRASES.

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. 750 Illustrations.

PRICE, $5.00.

THE ELECTRIC MOTOR AND ITS APPLICATIONS.

By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT OF DYNAMOS AND MOTORS.

By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS FOR THE USE OF Engineers and Architects.

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. Profusely Illustrated.

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.

Experiments with Alternate Currents.

By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

Dictionary of Electrical Words, Terms and Phrases.

By EDWIN J. HOUSTON, A. M.

562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

The Scheme of Treatment is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

ELECTRICITY FOR ENGINEERS.

Part I, 268 Pages, $2.00. **Part II, 156 Pages, $1.00.**

WHEN ORDERED TOGETHER PRICE IS $2.50.

Both Works Profusely Illustrated.

☛ **Just the Work for Engineers, Electricians, Dynamo Tenders, etc.**

PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current — How Produced — Induction — Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting— Testing— Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel— Multiple Series — Multiple Series Cut-Out — Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators — Brushes — Different Styles of Brushes — Double Brushes—Single Brushes — Troubles with Commutators and Brushes — Correct Position of Brushes—Sparking at Brushes — Care of Brushes and Commutators — Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howe l Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation — Dynamo — Extra Brush — Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers — Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from those used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation — Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

Orders Promptly Filled on Receipt of Price. POSTAGE PREPAID.

INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

CONTENTS.

PART I.—Polyphase Currents.

CHAPTER 1....Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors.—Synchronizing Motors.—Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lectures On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31....."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

PART III.—Miscellaneous Inventions and Writings.

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by

PATENTS.—Twenty years' experience. Send model or sketch and brief description of your invention for report as to patentability. Expert searches and opinions. Patent causes prosecuted and defended. Practice in U. S. Supreme, Circuit and Circuit Appeals Courts, and U. S. Patent Office. Send for "Plain Words about Patents," free. Patent practice exclusively.
E. B. STOCKING, Attorney at Law, 611 F St., N.W., **Washington, D. C.**

BINDERS FOR THE **WESTERN ELECTRICIAN,** **ONE DOLLAR.**

WESTINGHOUSE ELECTRIC & MANUFACTURING CO.,

PITTSBURGH, PA.

We manufacture Complete Installations of

ELECTRICAL APPARATUS

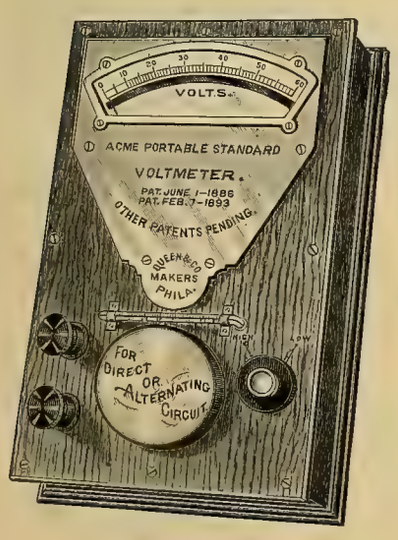
For **CENTRAL STATION ELECTRIC LIGHTING,**
LONG DISTANCE TRANSMISSION OF POWER,
ELECTRIC RAILWAY AND ISOLATED PLANTS.

BRANCH OFFICES IN ALL LARGE CITIES.

The "Acme" Standard Portable Voltmeter.

. . . . Equally accurate for Direct and Alternating Currents . . . .

BUILT UNDER THE CARDEW HOT WIRE PATENTS.



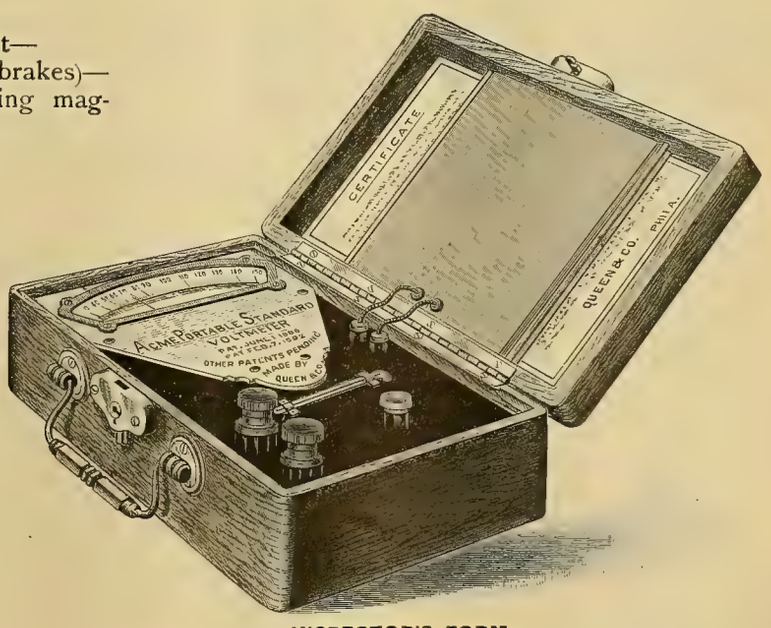
LABORATORY FORM.

Well designed throughout—
Dead beat (without using brakes)—
Unaffected by surrounding magnetic field—
No magnetic lag—
No self-induction.

Correct permanently within one-half of one per cent.

Sealed to prevent tampering. Single scale — Double scale.
(See Circular 525 for prices.)

When needing Electrical Testing Instruments, mention this advertisement, for a copy of Catalogue T, 112 pages fully illustrated.



INSPECTOR'S FORM.

QUEEN & CO., Incorporated.

PHILADELPHIA.

Medal and Eight Diplomas at World's Fair . . .

CITY ELECTRICAL INSPECTION DEPARTMENT.

Certificate No. 2201. January 10, 1894.

Building, Ryerson Laboratory.
Chicago University Campus.
Building wired by L. K. Comstock.
Wire used N. I. R. as follows:—

Main wires, Sizes	No. 3,	nnmber of feet	2,172.
"	No. 8,	" "	240.
"	No. 14,	" "	25,000.

Insulation resistance—Ten Megohms over all.
Capacity for 640 Incandescent Lamps 110 volts.

J. P. BARRETT,
Supt. City Telegraph.

E. F. NORTON, Act. Chief
City Electrical Inspection.

Building lathed with wire lathing, wire run over and under the lathing.

Each floor on the New York Life runs over 8 Megohms.

WM. H. McKINLOCK, President. WALTER C. McKINLOCK, Secretary.

ARC LAMP

FOR

INCANDESCENT

AND

RAILWAY CIRCUITS.

The Smallest Practical Arc Lamp on the Market.

Combines the following advantages not found in any other lamp:

Ease of Carboning.
Motion of carbon rod entirely free. No loss of time in changing. No waste of carbon life.

Fewness of Parts.
Parts interchangeable with all lamps.

Steady Burning--No Hissing.

Perfect Regulation.
Regulation and feeding point independent of weight of carbon.

Simplicity and Sensitiveness of Feed Mechanism.
Neither clutch nor gear, but combines advantages of both. No troublesome escapement.

Ease of Installation and Adjustment.
Labor reduced to a minimum.

Ornamental Thomson Arc Lamp.

Plain Lamps, Ornamental Lamps, Short Lamps.

NOW READY FOR DELIVERY.

When the Use of the Arc Lamp Becomes General.

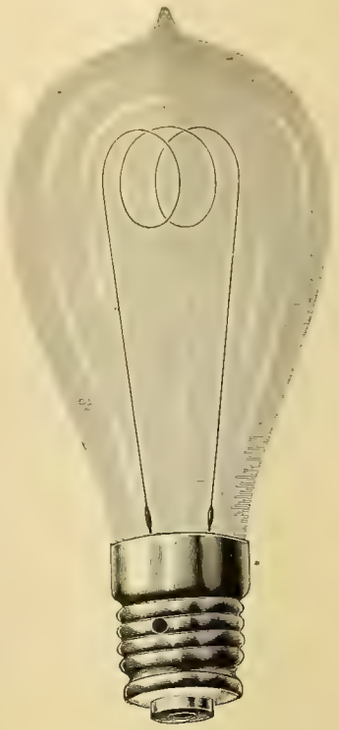
TWO LETTERS.

Extract from Letter No. 1.

"No! I've made up my mind to test the ***cheap lamp*** racket. The 'Buckeye' is all right, the best lamp ever placed on our circuit, ***but***—I am offered a lamp with individual life guaranty of 600 hours, two cents for bases returned; making the net ***first*** cost about ***five cents*** less than your quotation; so—frankly, I'm like the boy, who, in his customary manner upon going to bed kissed his mamma good night, but on this particular night did not say his prayer as usual, but hustled into bed, chucked the covers close up about his chin and ears, and closed his eyes preparatory to sleep. 'Willie, dear, said his mamma, haven't you forgotten something?' 'Nope,' answered Willie; 'Why—you haven't said your prayer!' 'I know it,' said Willie. 'Ain't a going to say 'em to-night, or to-morrow night, an if I ***get along*** all right ain't going to say 'em ***any more.'*** Now if I can ***get along all right*** with the ***cheap lamps,*** of course I shall be compelled to use them in the future."



Extract from Letter No. 2.

"Well, I've tried 'em—the ***cheap lamps*** I mean—and here I am back again 'Prodigal Son' like; somewhat the worse for wear and tear of nerves incident to the ***care*** required by my ***late investment;*** I found the lamps faulty in every way, the bulbs full of sand blisters, the filaments ***spotted,*** evidently improperly treated, and the way they broke, and sagged to ***side of bulb*** when placed at an angle was a ***caution.*** The bases were poorly fastened and I think in order to make a ***cheap*** lamp the manufacturer actually ***skimped*** in the ***quantity of water*** needed to properly mix the plaster of paris. The first few returned on account of not having burned more than 50 to 75 hours, were replaced, but when it became evident that quite one-half would fail on their guaranty, the party who sold me the lamps declined to replace them. Of course my customers became dissatisfied, but I have quieted them by saying that 'Buckeye' lamps have been ordered and are on the way.

"Haven't heard how that boy ***got along*** without saying his prayers; one thing sure: I ***won't*** get along without 'Buckeye" lamps.'

NO INJUNCTION,
NO BOND
HANGING OVER

THE BUCKEYE LAMP.

SUMMARY.

RESULTS are what you want, friends, not pretense nor subterfuge. Honest goods require only honest statements to find their market. ***Quality*** produces the ***result.***

If you write us for information regarding the "Bu keye" lamp you'll get the ***truth*** without ***sliding panels or false bottoms.***

If you want a { **3 Watt Lamp,** / **3 2-10 Watt Lamp,** / **3 1-2 Watt Lamp,** / **4 Watt Lamp,** / **or any other efficiency** } **we can furnish it.**

You undoubtedly place your orders where you ***anticipate*** the best value for your money. The ***coiled*** filament with its beautiful illuminating effect;

THE LOW OPERATING COST,
THE LONG LIFE AND
THE PURE WHITE LIGHT

All combined in the "Buckeye" Lamp, is a guaranty against failure or disappointment.

We are making prompt deliveries from our factory, and CHICAGO stock.

The Buckeye Electric Company,

CHICAGO, 753 Monadnock. **FACTORY, Cleveland, Ohio.**

W. W. GIBBS, President. HERBERT LLOYD, F. C. S., General Manager.

THE ELECTRIC STORAGE BATTERY CO.,

SOLE MANUFACTURERS OF

The Chloride Accumulator.

DREXEL BUILDING, PHILADELPHIA, March 2, 1894.

The Electric Storage Battery Company of Philadelphia on account of the misleading, unreliable and mistaken statements made by the manufacturers of the various storage batteries, in order to obtain for the public reliable information as to the relative merits of such batteries manufactured in this country, proposes to place in the hands of the eminent firm of Electrical Experts, MESSRS. HOUSTON & KENNELLY, OF BETZ BUILDING, PHILADELPHIA, a Chloride Accumulator of any given weight, to be tested by them against batteries of like weight of any or all other types manufactured in this country, whose makers are willing to submit to such competitive tests, with the understanding that there shall be deposited with such firm of experts by each party who enters into competition the sum of five hundred dollars. The Electric Storage Battery Company agrees to deposit a like sum against each competitor, with the understanding that in every case where the Chloride Accumulator does not prove to be at least fifty per cent. better, efficiency, capacity and durability (the essential features) being all considered, said deposits of one thousand dollars to be paid to each winning competitor, and in each case where the Chloride Accumulator proves in said tests to be fifty per cent. better, all three above essential features being considered, the one thousand dollars so deposited shall be awarded to The Electric Storage Battery Company; each party participating in said competition to contribute his proportion of the expenses incident thereto.

In order that the tests may be of the greatest practical value, The Electric Storage Battery Company suggests that a small cell suitable for traction, or other purposes, weighing about fifty pounds, and a larger cell, suitable for central station work, weighing from five hundred to a thousand pounds, be entered, although said company will meet the weight of any element that may be entered.

All parties desirous of entering these competitive tests will please communicate directly with Messrs. Houston & Kennelly, Electrical Experts, 1107 Betz Building, Philadelphia.

This challenge shall remain open for ninety days from March 1, 1894.

Messrs. Houston & Kennelly have agreed to undertake such competitive tests on the conditions contained in their letter which follows.

THE ELECTRIC STORAGE BATTERY COMPANY.

Office of HOUSTON & KENNELLY,

1107 BETZ BUILDING, PHILADELPHIA,
March 2, 1894.

THE ELECTRIC STORAGE BATTERY COMPANY,

DREXEL BUILDING, PHILADELPHIA.

GENTLEMEN:—We agree to make the above tests on the following conditions:

1. All results to be published.
2. Each contestant to be permitted to have one representative present at the firm's laboratory during the tests.
3. Each contestant to be permitted through his representative to withdraw his battery at any time, but in all such cases the tests will be published up to the point of withdrawal, and the deposit will be forfeited to the opponent.
4. No tests will be commenced until after the battery has been discharged one hundred times at a rate of three-quarters of an ampere per pound of electrode as shipped.
5. The tests to be of three kinds, namely: efficiency tests, capacity tests and durability tests.
6. The efficiency to be the ratio of output to intake, and to be measured in watt hours for energy capacity, and in ampere hours for current storage capacity. The battery to be considered as discharged when the E. M. F. per cell, on opening the circuit, falls below 1.75 volts. The criterion of full charge to be agreed upon in writing before the tests commence in each case.
7. The current capacity to be determined in ampere hours output from the point of full charge to E. M. F. of 1.75 volts as above, and to be rated in capacity per pound weight of charged cell, and per pound weight of dry electrodes as shipped.
8. The above tests to be made at varying rates of discharge per pound weight of dry electrodes as shipped, in order to determine the range of efficiency and capacity at varying outputs. In deciding the relative merits of two competing cells whose efficiency or capacity may be equal at different rates of discharge, the award will be given to the cell possessing the greater efficiency at the higher rate of discharge per pound of plate weight as above.
9. The durability tests to be made on the completion of the preceding tests and to be under conditions no more severe than those required for traction work. The durability will be measured by determining the number of working hours of charging and discharging at the rate of two and one-half amperes per pound of dry electrodes as shipped, which will reduce the storage capacity of the battery in ampere hours to one-half of its first valuation at that output.
10. The award will be made on the basis of the sum of the percentages of the Chloride Accumulator over contesting batteries on the three claims of efficiency, capacity and durability. The mean efficiency or energy and current, and the capacity in ampere hours of battery and electrodes being selected as the relative competitive efficiency and capacity in each case.

The efficiency, capacity and durability of the contesting cell will then be divided into the corresponding efficiency, capacity and durability of the Chloride cell, and if the sum of the three quotients exceeds three and one-half, *i. e.* three hundred and fifty per cent. minus three hundred per cent., the decision will be given in favor of the Chloride cell, but not otherwise.

Very respectfully,

HOUSTON & KENNELLY.

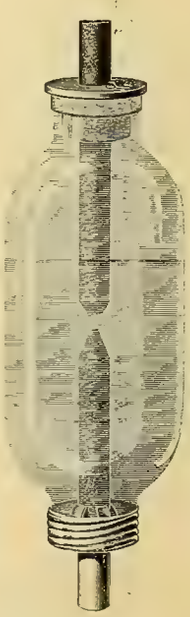
N. E. Ins. Exchange.



"A complete fire protector and practical apparatus."
A. C. DUNHAM,
Pres.,
Hartford Elec. Lt. Co.

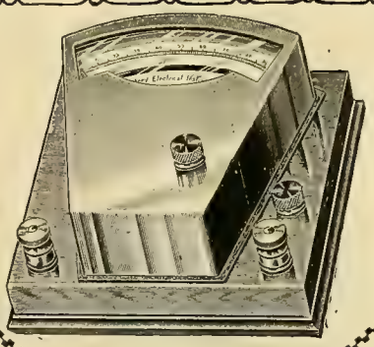
Life of one pair of 7/16 inch carbons over 100 hours.

This system has been introduced in the City of Hartford, Conn. by the Connecticut Royal Arc Co., and has been in continuous operation on street and commercial circuits for the past five months. Merchants in the City of Hartford employing Arc Lights by adopting this appurtenance have been able to save 33⅓ per cent. from established rates made by the Hartford Board of Fire Underwriters.

The commercial advantages enjoyed when this equipment is adopted are many: Cleanliness, removal of anxiety in regard to fire and the necessity for trimming the lamp reduced to twelve times per year, where average lamp hours are employed.

THE ROYAL ARC ELECTRIC CO., U. S. A. 143 Liberty St., New York.

WIRES AND CABLES.



WHITNEY INSTRUMENT.

WIRES AND CABLES.

THE REASON WHY

You should use a high grade wire on your lines is because you are reducing the loss by leakage, not only for a day or a week, but for the life of your circuit.

WHAT PROFITETH IT A MAN

If he save a whole cent a pound on his weatherproof wire and lose "his wad."

O. K. LINE WIRE GIVES THE RESULTS

AT THE BOTTOM PRICE.

It occupies the place among weatherproof wires that is held among rubber-covered wire by

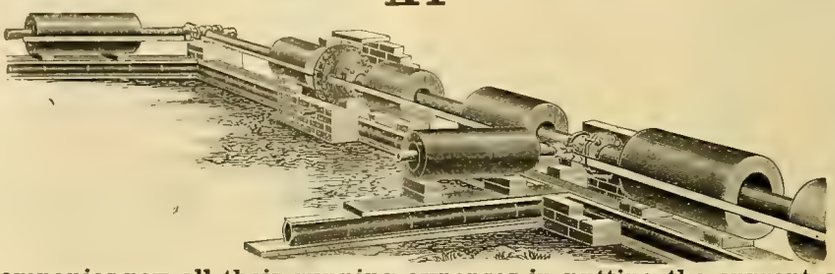
Electricity Free of Cost

AT

Central Stations.



Many of the electrical companies pay all their running expenses in putting the current on the wires from the sale of their *EXHAUST STEAM.*

This they do by the *HOLLY SYSTEM* of underground steam distribution, which heats dwellings, stores, offices, churches and public buildings from the sale of a by-product, which other companies are allowing to go to waste.

It is a legitimate source of revenue, and helps to pay dividends. For particulars, address

AMERICAN DISTRICT STEAM CO., Lockport, N. Y.

WIRT INDICATORS.

I have purchased the Wirt Laboratory from the assignee of the Ansonia Electric Co., together with a large stock of Wirt Indicators; these instruments are all new and in first class condition. They include indicators for direct and alternating current ranging from 10 to 1,000 amperes and from 2½ to 3,000 volts. While this stock lasts I will make extremely low prices. Apply to the undersigned or to your regular dealer.

CHARLES WIRT, 56 5th Avenue, Chicago, Ill.

THE

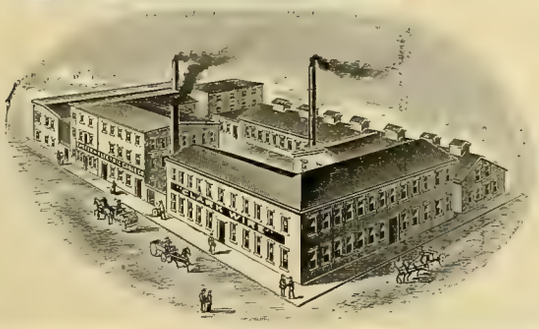
"CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

Siemens & Halske Electric Company of America,

Siemens & Halske, Berlin, Charlottenburg, Vienna, St. Petersburg.

MANUFACTURERS OF

DIRECT CURRENT MULTIPOLAR DYNAMOS AND GENERATORS.

These machines are constructed with outside revolving armatures, without and with special commutator, as desired. They have proved remarkably efficient and economical. Used largely in European Central Stations. They are slow-speed machines, made for direct connection to engine without belting, and in sizes from 20 H. P. to 1,500 H. P.

HIGH-SPEED BELTED SIEMENS DYNAMOS
Are copied extensively in this country as "Drum Type." We are building these machines in size from 1 H. P. to 150 H. P.

ALTERNATING AND MULTIPHASE CURRENT DYNAMOS
With laminated field and armature, in sizes from 1 H. P. to 4,000 H. P., for belted or direct coupling.

MOTORS
Of every speed for direct, alternating or multiphase current, in sizes from 1-10 H. P. up to 4,000 H. P. Durable and economical in operation.

SIEMENS BAND LAMPS
For direct and alternating current, for constant potential and series machines.

SIEMENS ARC LIGHT CARBONS
With either solid or soft cores, which are the most economical in the world and give a steady light.

ALL INSTRUMENTS
Requisite for the regulation of electric apparatus; also the Siemens Voltmeters and Ammeters and Automatic devices made in Berlin.

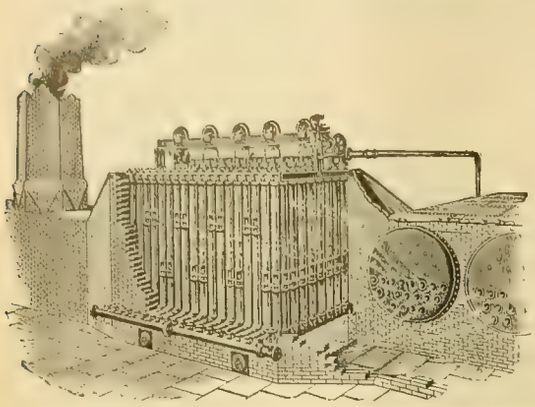
THE FUEL ECONOMIZER CO.,

Of Matteawan,



SOLE MAKERS IN THE UNITED STATES OF
GREEN'S IMPROVED PATENT ECONOMIZER
FOR STEAM BOILERS.

This apparatus heats the feed water to a temperature very much above boiling point by the waste gases escaping from boiler flues. Highest Award at the Columbian Exposition, Chicago, 1893.

TO ALL ELECTRICAL ENGINEERS:—The large reserve of water, at a high temperature, held in the Economizer to meet the sudden demands common to all Electric Railroads, renders an Economizer absolutely indispensible to the modern power plant of the present day.

Can be applied to any kind of boiler without stoppage of works.

Offices and Works, MATTEAWAN, N. Y.

SPECIAL ANNOUNCEMENT.

"THE HELIOS"

SPECIAL ALTERNATING ARC LAMP

Can be run three in series from 105 volt secondary circuit.

STANDARD ALTERNATING ARC LAMPS

Can be run in multiple from 50 or 100 volt secondary circuits by Spencer Economy Coils.

No Special Transformers Necessary. No Dead Resistance Required. No Change of Wiring.

SPECIAL NOTICE.

Helios Carbons will be sold only with the Helios Lamp. The Helios is the only lamp that has a legal right to use the reflector plate between the standards, without which one-half of the light is wasted.

THE JUPITER BATTERY.
(TRADE MARK.)

NOTE THESE POINTS:

1—"Buckling" and Short-Circuiting absolutely impossible.
2—No Perforated Plates.
3—Very small loss of Current on open Circuit.
4—Cannot be injured by ANY NUMBER of short circuit discharges.
5—Will not sulphate from overcharging.

WE MAKE A SPECIALTY OF PORTABLE CELLS.

Our small motors are the ***most compact*** of any on the market. Any voltage. No "scrap iron" but the ***best workmanship.***

We want agents at once, everywhere, for our Automatic Safety Elevator Brake; instantly reverses the elevator, when any obstacle projects into the well in the pathway of the car.

ELECTRICITY FOR ENGINEERS.

Part I, 268 Pages, $2.00. **Part II, 156 Pages, $1.00.**

WHEN ORDERED TOGETHER PRICE IS $2.50.

Both Works Profusely Illustrated.

☛ **Just the Work for Engineers, Electricians, Dynamo Tenders, etc.**

PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current — How Produced — Induction — Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting—Testing—Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel—Multiple Series — Multiple Series Cut-Out — Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators — Brushes — Different Styles of Brushes — Double Brushes—Single Brushes — Troubles with Commutators and Brushes — Correct Position of Brushes—Sparking at Brushes — Care of Brushes and Commutators — Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation — Dynamo — Extra Brush — Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers — Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from those used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation — Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

RAILWAY CIRCUITS.

The Smallest Practical Arc Lamp on the Market.

Combines the following advantages not found in any other lamp:

Ease of Carboning.
Motion of carbon rod entirely free. No loss of time in changing. No waste of carbon life.

Fewness of Parts.
Parts interchangeable with all lamps.

Steady Burning--No Hissing.

Perfect Regulation.
Regulation and feeding point independent of weight of carbon.

Simplicity and Sensitiveness of Feed Mechanism.
Neither clutch nor gear, but combines advantages of both. No troublesome escapement.

Ease of Installation and Adjustment.
Labor reduced to a minimum.

Ornamental Thomson Arc Lamp.

Plain Lamps, Ornamental Lamps, Short Lamps.

NOW READY FOR DELIVERY.

When the Use of the Arc Lamp Becomes General.

FOR
60 DAYS.

The finest designs and best assortment ever offered. Can make immediate shipments of every kind from stock.

ASK FOR QUOTATIONS, STATING QUANTITY.

Also a complete line of Electric House Goods at the same reduction.

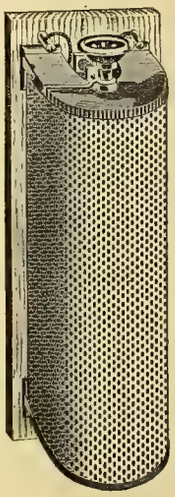
HUGH McMILLAN,

1424 Woodward Avenue,

DETROIT, - MICHIGAN.

MENTION THIS PAPER IN ANSWERING.

MEISSNER'S IMPERIAL
Rheostat and Stage Dimmer.

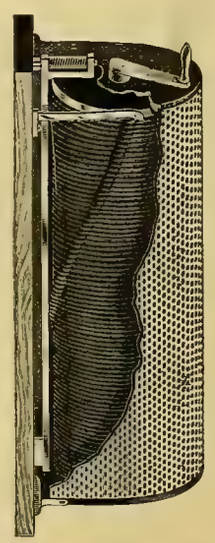


Contact made on wires direct instead of on segment face.

Changes from light to dark and vice versa, made perfectly even and gradual.

Finest scenic effects produced without difficulty.

INCOMBUSTIBLE,
DURABLE,
COMPACT and
REASONABLE IN PRICE.



Meissner's Improved Theatrical Focusing Lamp—best in the world.

Meissner's Focusing Lamp for photo-engraving and stereoscopic work has no equal.

For particulars apply to

WASHINGTON ELECTRIC CO.,

197 and 199 S. Canal St., Chicago.

STREET LIGHTING FROM ALTERNATING CURRENT DYNAMOS.

New Prices given on **Lamps, Series Sockets, Street Fixtures, Poles, Bank Boards, Meters**

And all accessories for the use of SERIES LAMPS on ALTERNATING CURRENT DYNAMOS.

This system permits a PROFITABLE and SATISFACTORY method of street illumination and should be investigated by every plant using alternating current apparatus. WRITE FOR FURTHER PARTICULARS AND PRICES.

OUR SERIES LAMPS

Will show you a COMPARATIVE SAVING equal to their FIRST COST in POWER CONSUMED.

BERNSTEIN ELECTRIC COMPANY, 620 Atlantic Ave., Boston, Mass.

PROGRESS.

Electrical Engineers, Contractors, Wiremen, Architects—why not lead in raising the standard of electrical installations, instead of following the Underwriters?

We can help you. You can help yourselves by using

INTERIOR CONDUITS,

METAL SHEATHED BUSHINGS,

OKONITE WIRE,

The Standards Approved by the Underwriters and City Inspectors.

CENTRAL ELECTRIC COMPANY,

116 AND 118 FRANKLIN STREET, - - CHICAGO.

Southern Electrical Supply Co., St. Louis Agents.

Gate City Electric Co., Kansas City Agents.

THE HOWARD SYSTEM.

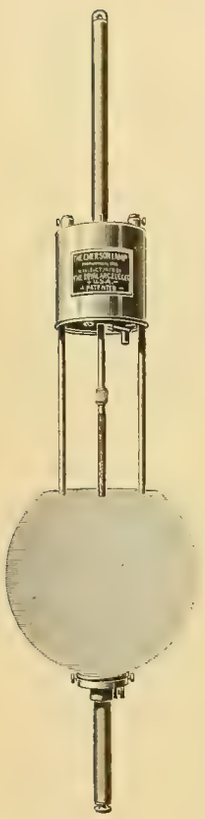
"THE NEW INCANDESCENT ARC LIGHT."

PERFECT DISTRIBUTION OF LIGHT.

FOR ALL CIRCUITS.

COST OF TRIMMING REDUCED TO A MINIMUM.

APPURTENANCES CAN BE ATTACHED TO ANY MAKE OF ARC LAMP.

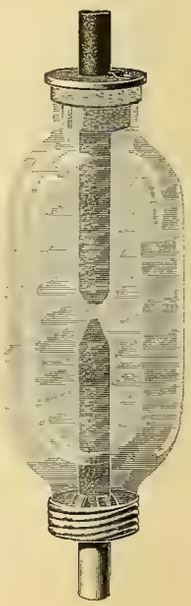


"The importance to the future of the electric lighting industry cannot be over-estimated." *The Electrical Engineer, New York.*

"The most efficient spark arrester presented."
C. M. GODDARD, Sec.,
International Underwriters' Ass'n.

"The best spark arrester that can be devised."
F. E. CABOT, Supt.,
Boston Board of Fire Und.

"Unqualified approval as a spark arrester."
C. M. GODDARD,
Treas.,
N. E. Ins. Exchange.



"A complete fire protector and practical apparatus."
A. C. DUNHAM,
Pres.,
Hartford Elec. Lt. Co.

Life of one pair of $\frac{7}{16}$ inch carbons over 100 hours.

This system has been introduced in the City of Hartford, Conn. by the Connecticut Royal Arc Co., and has been in continuous operation on street and commercial circuits for the past five months. Merchants in the City of Hartford employing Arc Lights by adopting this appurtenance have been able to save 33⅓ per cent. from established rates made by the Hartford Board of Fire Underwriters.

The commercial advantages enjoyed when this equipment is adopted are many: Cleanliness, removal of anxiety in regard to fire and the necessity for trimming the lamp reduced to twelve times per year, where average lamp hours are employed.

THE ROYAL ARC ELECTRIC CO., U. S. A. 143 Liberty St., New York.

STORAGE BATTERIES, FOR TROLLEY LINES,

— AND —

Central Lighting Stations,

Properly Installed and Guaranteed,

REQUIRE

Less Investment,
Less Power,
Less Labor,

SECURE

Greater Economy,
Constant Load,
Constant Voltage.

[Our 30 H. P. cell (12,000 ampere hours) occupies one-half cubic yard.]

The Accumulator Company,

224 Chestnut Street, Philadelphia.

Electric Motors and Generators.

Arc

Incandescent Lighting Machines.

SOMETHING NEW.

An Arc Lamp without Spring, Wax, Glycerine or Mercury.

Send for Samples of the

NEW BRUSH ARC LAMP.

THE ONLY LAMP FOR ALL-NIGHT LIGHTING.

STORAGE BATTERIES!

OUR STORAGE BATTERIES
Contain no active material artificially applied.

WE ARE NOT COMPELLED
To use Asbestos Coverings, Perforated Rubber Sheets or other confining plates

BECAUSE WE DO NOT REQUIRE THESE ARTIFICIAL SUPPORTS FOR PREVENTING THE ACTIVE MATERIAL FROM FALLING OUT.
We do not claim great "capacity per pound weight," but

WE DO CLAIM TO HAVE A BATTERY COMBINING DURABILITY
And efficiency in a higher degree than any other Battery made in this country.

☞ We Guarantee This to Purchasers.

THE HIGHEST AWARD FOR STORAGE CELLS
At World's Columbian Exposition, Chicago, was given to us.

WE ARE READY TO SPEND MONEY DEMONSTRATING
The value of our cells in actual service, but we have no money to spend

FOR DRAWN OUT AND IN THE END VALUELESS TESTS

as far as durability and efficiency in actual service is concerned.

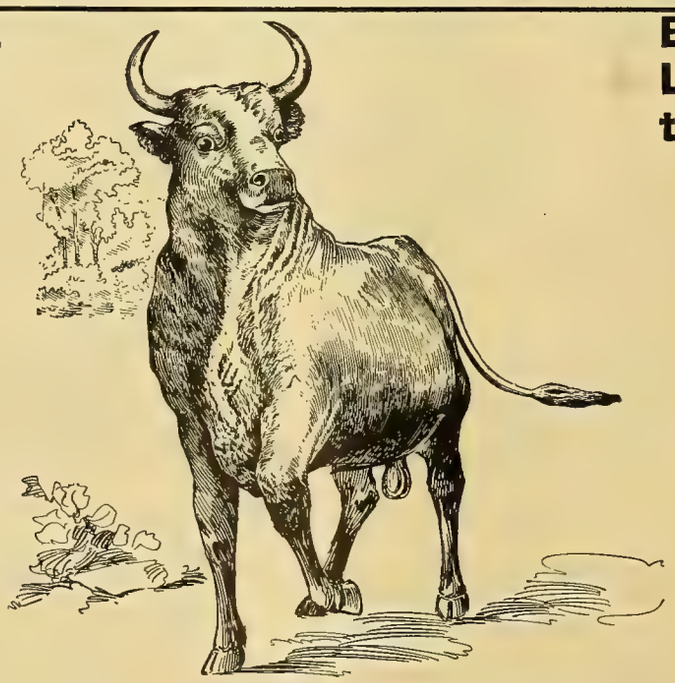
GOOD RESULTS IN ACTUAL SERVICE
Are what the practical purchaser is looking for.

WE HAVE OVER 1,500 CELLS IN SUCCESSFUL TRAIN LIGHTING SERVICE ALONE.

For further information, write to

AMERICAN BATTERY CO., 188 MADISON ST., - CHICAGO.
Send for new "Light and Power" Catalogue.

Don't make a Alternating Arc investigating



By Buying any Lamp before the

MON-ARC

Everything about it is of the very best. Brass Frame, Brass Shell, Brass Cap, Brass Rods. No tin or stovepipe iron. It combines unequaled simplicity with absence of all objectionable features heretofore present in alternating lamps. It is a **NON-STICKER** that central station men and lamp trimmers will be **STUCK** on because they don't have to **MONKEY** with it every few days, taking it down to clean and oil. Lamps for all systems. We guarantee every lamp. Write for prices.

THE F. P. LITTLE ELECTRICAL CONSTRUCTION & SUPPLY CO., Buffalo, N. Y.

McDOUGALL, LUCAS & CO., Gen'l Western Agents, The Rookery, Chicago.

TELEPHONE
WIRE AND CABLES.

Every Telephone Company in the United States is using Kerite Wire and Cables. Kerite is the Standard of High Grade Insulation, and will Out Last and Out Class any other on the Market.

225 Dearborn St., Chicago.

W. R. BRIXEY, Mfr.
203 Broadway, New York.

We are the **General Western Agents** for the **VIADUCT MFG. CO.,** of BALTIMORE, MD., and have a full line of **COMPLETE TELEPHONES, Telephone Switch Boards,** Magneto Bells with Patent Arm-rest Switch, Magneto Bells for Testing Purposes, District Messenger Boxes, etc., etc.

These goods have long been regarded as the **BEST.** Get our circulars and prices. Deliveries made from Chicago **STOCK.**

We are also the **Sole Manufacturers** of the popular MONARCH **Incandescent LAMPS.**

The large and increasing **demand** for this lamp shows **better** than anything else the **good results** our patrons **secure** in their use, because they are well and **carefully** made, and our **prices** are low, too.

Let us ship you a trial lot, which we **guarantee** as we represent.

All styles shipped **promptly.**

Edward Lasell & Co.,
225 Dearborn Street, - CHICAGO, ILL.

CHICAGO, Wabash Avenue and Lake Street.

ELECTRIC TELEPHONES.

We are prepared to furnish first-class telephone receivers in quantities at very low prices.

Our complete outfit, including transmitter, receiver and signaling apparatus, will be ready for delivery after February 15th. These outfits will have an automatic circuit-changing device, which we guarantee is no infringement.

We are headquarters for telephone receiver shells, permanent bar magnets, magneto bells, line material, etc.

THE MESCO DRY BATTERY

is recommended for telephone transmitter and all other open circuit work. **Over 200,000 in use. PRICES REDUCED,** making it the cheapest reliable open circuit battery on earth.

GET OUR PRICES on Leclanche batteries, zincs, Manhattan door opener (no push-out spring required), watchman's clocks (just out). Special low prices on speaking tubes, whistles, bronze push buttons and annunciators. We have a **Job lot** of spun, bronze and nickel plated push buttons.

If you will send us your address we will get some of your trade.

OFFICES IN ALL THE LEADING CITIES.

We have such a large and complete line of high grade electrical specialties and supplies; make such prompt shipments, and bill our goods at such unquestionable low prices that it is hard for us to understand why we do not get all of

EVERYBODY'S BUSINESS.

Still, we undoubtedly get a large share of it, and make those who place all of their orders with us

PARTICULARLY HAPPY

So that we probably have no reason to complain.
The purpose of the above soliloquy is to call your attention in a quiet way to the fact that we ought to

HAVE YOUR BUSINESS.

If a mere statement of this fact is not sufficient send us your next order and be convinced.

ELECTRIC APPLIANCE COMPANY.

THE

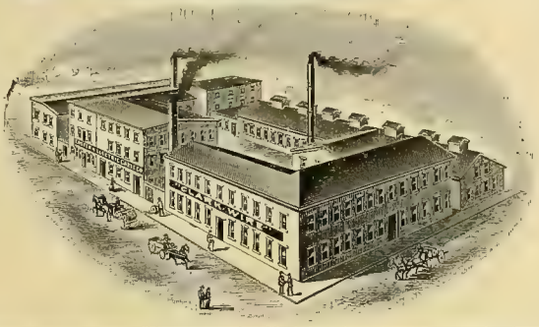
"CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

The "Ideal" Storage Battery
For all Classes of Work where Light and Power are Required.

NORTH AMERICAN PHONOGRAPH COMPANY.
CHICAGO, ILL., September 13, 1893.

MESSRS. BRADBURY-STONE STORAGE BATTERY CO., Lowell, Mass.

GENTLEMEN:—We take a great deal of pleasure in being able to laud the merits of the Bradbury-Stone Ideal Storage Battery for use in connection with the Phonograph. Within the last few months we have purchased in all several hundred of your cells, and have shipped them on orders to various parts of the country in almost every conceivable manner. They have withstood the most severe tests, and have in all cases given entire satisfaction.

Yours truly, THOS. R. LOMBARD, General Manager.

Thousands in use all over the country.

ELECTRIC TRANSMISSION HAND-BOOK.

Lieut. F. B. Badt's latest addition to our famous hand-book series, of which 30,000 copies have been sold. The new book deals in the author's well-known practical style with all the problems of Electric Power Transmission.

NOW READY. PRICE $1.00.

ELECTRICIAN PUBLISHING CO., 6 Lakeside Building, CHICAGO.

YOU NEED THESE BOOKS.

NEW
DYNAMO TENDERS' HAND-BOOK.
By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. *138 Engravings.*

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.
By Lieut. F. B. Badt.

Fourth Edition. **Tenth Thousand.**

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. **42 Illustrations.**

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.
By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.
By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS.
"TRAMS."
Their Construction, Operation and Maintenance.
By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. *Profusely Illustrated.*

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.
By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY ... OF ... ELECTRICAL WORDS,
TERMS AND PHRASES.
By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. **750 Illustrations.**

PRICE, $5.00.

THE ELECTRIC MOTOR AND ITS APPLICATIONS.
By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT
OF
DYNAMOS AND MOTORS.
By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS
FOR THE USE OF
Engineers and Architects.
By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the Natfonal Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.
By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. *Profusely Illustrated.*

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.
Experiments with Alternate Currents.
By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.
By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.
By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

ARC LAMP

FOR

INCANDESCENT

AND

RAILWAY CIRCUITS.

The Smallest Practical Arc Lamp on the Market.

Combines the following advantages not found in any other lamp:

Ease of Carboning.
Motion of carbon rod entirely free. No loss of time in changing. No waste of carbon life.

Fewness of Parts.
Parts interchangeable with all lamps.

Steady Burning--No Hissing.

Perfect Regulation.
Regulation and feeding point independent of weight of carbon.

Simplicity and Sensitiveness of Feed Mechanism.
Neither clutch nor gear, but combines advantages of both. No troublesome escapement.

Ease of Installation and Adjustment.
Labor reduced to a minimum.

Ornamental Thomson Arc Lamp.

Plain Lamps, Ornamental Lamps, Short Lamps.

THE ELECTRIC STORAGE BATTERY CO.,

W. W. GIBBS, President.
HERBERT LLOYD, F. C. S., General Manager.

SOLE MANUFACTURERS OF

THE CHLORIDE ACCUMULATOR,

DREXEL BUILDING, PHILADELPHIA.

We see in your issue of March 17, an advertisement of a storage battery company in which they refer indirectly to the challenge made by the Electric Storage Battery Company, and make certain excuses for not being willing to enter into a competition such as we proposed, stating that they are ready to spend money to demonstrate the value of their cells in actual service, but have no money to spend for drawn out and in the end valueless tests, as far as durability and efficiency in actual service are concerned.

In order to meet a case of this kind, we propose to this battery company that they may name the conditions under which they would consider a test practicable to determine the relative commercial value.

We make the claim that our battery has more than 50 per cent. greater commercial value than the battery referred to, or any other battery manufactured in this country, and are prepared to meet any conditions necessary to determine the correctness of our statement.

We know from past experience and statements that have been made by manufacturers of storage batteries, from time to time, that claims such as are made by this company without some reliable means of verification, are of no value.

We know we have the best battery, and we are willing to adopt any means and meet any conditions which will enable the public to determine the fact.

Very truly yours, **W. W. GIBBS**, President,
ELECTRIC STORAGE BATTERY CO.

THE

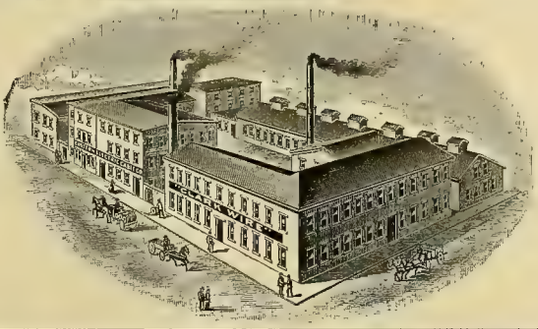
"CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

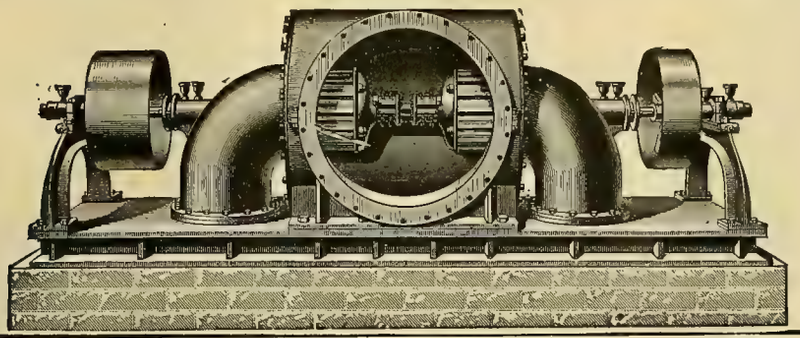
VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high Speed and great Efficiency,** and **large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

SEND FOR CATALOGUE AND PARTICULARS.

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of 12 inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast-Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

STILWELL & BIERCE MFG. CO., DAYTON, OHIO.

PRICE, $1.50.

THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. Profusely Illustrated.

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.

Experiments with Alternate Currents.

By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

Dictionary of Electrical Words, Terms and Phrases.

By EDWIN J. HOUSTON, A. M.

562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

The Scheme of Treatment is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

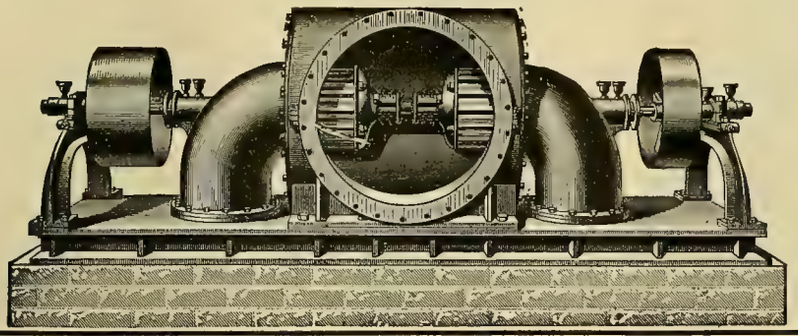
VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high Speed and great Efficiency,** and **large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

SEND FOR CATALOGUE AND PARTICULARS.

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of 12 inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast-Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

STILWELL & BIERCE MFG. CO., DAYTON, OHIO.

THIS CUT represents the Law Fuller Mercury Bichromate Cell, used by Telephone Companies and Doctors for laboratory work, experimental work and in places where a close-circuit cell, that requires no attention and will last a long time, is desirable. We can quote you prices on this cell that will surprise you, and we should be very pleased to hear from you and submit samples if necessary.

INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

CONTENTS.

PART I.—Polyphase Currents.

CHAPTER 1....Biographical and Introductory.
CHAPTER 2....A New System of A ternating Current Motors and Transformers.
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors. —Synchronizing Motors.—Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31....."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

PART III.—Miscellaneous Inventions and Writings.

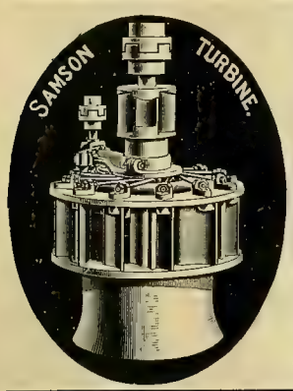
CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by

ELECTRICIAN PUBLISHING CO., 6 Lakeside Building, Chicago.



JAMES LEFFEL **WATER WHEELS**

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage**, and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

THE JAMES LEFFEL & CO. SPRINGFIELD, OHIO, AND NEW YORK CITY.

SPECIAL ANNOUNCEMENT.

"THE HELIOS"

SPECIAL ALTERNATING ARC LAMP

Can be run three in series from 105 volt secondary circuit.

STANDARD ALTERNATING ARC LAMPS

Can be run in multiple from 50 or 100 volt secondary circuits by Spencer Economy Coils.

No Special Transformers Necessary. No Dead Resistance Required. No Change of Wiring.

SPECIAL NOTICE.

Helios Carbons will be sold only with the Helios Lamp. The Helios is the only lamp that has a legal right to use the reflector plate between the standards, without which one-half of the light is wasted.

ELECTRICITY FOR ENGINEERS.

Part I, 268 Pages, $2.00. Part II, 156 Pages, $1.00.

WHEN ORDERED TOGETHER PRICE IS $2.50.

Both Works Profusely Illustrated.

☛Just the Work for Engineers, Electricians, Dynamo Tenders, etc.

PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current—How Produced—Induction—Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting— Testing— Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel—Multiple Series—Multiple Series Cut-Out—Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators—Brushes—Different Styles of Brushes—Double Brushes—Single Brushes—Troubles with Commutators and Brushes—Correct Position of Brushes—Sparking at Brushes—Care of Brushes and Commutators—Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation—Dynamo—Extra Brush—Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from Those Used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation—Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

Orders Promptly Filled on Receipt of Price. POSTAGE PREPAID.

The "Ideal" Storage Battery
For all Classes of Work where Light and Power are Required.

NORTH AMERICAN PHONOGRAPH COMPANY.
CHICAGO, ILL., September 13, 1893.

MESSRS. BRADBURY-STONE STORAGE BATTERY CO., Lowell, Mass.

GENTLEMEN:—We take a great deal of pleasure in being able to laud the merits of the Bradbury-Stone Ideal Storage Battery for use in connection with the Phonograph. Within the last few months we have purchased in all several hundred of your cells, and have shipped them on orders to various parts of the country in almost every conceivable manner. They have withstood the most severe tests, and have in all cases given entire satisfaction.

Yours truly, THOS. R. LOMBARD, General Manager.

Thousands in use all over the country.

Bradbury-Stone Electric Storage Co.,
Boston Office, 542 Exchange Bldg. **LOWELL, MASS.**

YOU NEED THESE BOOKS.

NEW
DYNAMO TENDERS' HAND-BOOK.

By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. *138 Engravings.*

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.

By Lieut. F. B. Badt.

Fourth Edition. **Tenth Thousand.**

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. **42 Illustrations.**

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.

By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.

By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS.
"TRAMS."

Their Construction, Operation and Maintenance.

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. *Profusely Illustrated.*

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.

By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY
... OF ...
ELECTRICAL WORDS,
TERMS AND PHRASES.

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. **750 Illustrations.**

PRICE, $5.00.

THE ELECTRIC MOTOR
AND ITS APPLICATIONS.

By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT
OF
DYNAMOS AND MOTORS.

By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS
FOR THE USE OF
Engineers and Architects.

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY
IN
THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. *Profusely Illustrated.*

PRICE, $2.50.

HIGH POTENTIAL
AND
HIGH FREQUENCY.

Experiments with Alternate Currents.

By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

Dictionary of Electrical Words, Terms and Phrases.

By EDWIN J. HOUSTON, A. M.

562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

The Scheme of Treatment is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

Vol. XIV. CHICAGO, APRIL 7, 1894. No. 14

DELAWARE HARD FIBRE COMPANY,

THE BEST ORIGINAL SUBSTITUTE FOR HARD RUBBER.

Adopted by the leading Electric Companies of the United States and Europe.

A More Satisfactory Insulator at Half the Cost.

Send for Our Illustrated Catalogue.

FACTORY, Wilmington, Del., Store, 15 Long Lane, LONDON.

CHICAGO AGENT, J. L. Thompson, 107 Dearborn Street.

An Honest Lamp, Honestly Made.

THE OLD RELIABLE

PACKARD LAMP.

5 to 500 Candle Power.

See that your lamps bear our registered trade mark.

NEW YORK & OHIO CO., - Warren, Ohio.

MAKERS OF PACKARD LAMPS.

WILLARD L. CANDEE, H. DURANT CHEEVER, } Business Managers. GEO. T. MANSON, Gen'l Supt.

THE OKONITE COMPANY LIMITED.

13 Park Row, New York.

OKONITE TRADE MARK

INSULATED

WIRES AND CABLES,

For Aerial, Submarine and Underground Use.

Candee Aerial Wires.

Manson Protecting Tape.

Okonite Waterproof Tape.

BRANCHES: Chicago, Boston, Philadelphia, Minneapolis, Cincinnati, Kansas City, Omaha, Louisville, St. Louis, San Francisco, London and So. America.

ALFRED F. MOORE,

MANUFACTURER OF

INSULATED ELECTRIC WIRE,

FLEXIBLE CORDS and CABLES.

200 and 202 North Third Street. - - PHILADELPHIA, PA.

DRY BATTERIES.

BEST OF ALL IS **THE STANDARD,**

Made by J. H. BUNNELL & CO., 76 Cortlandt St., New York.

Best Construction and Ingredients. Strongest, most Durable and Reliable. Size 6x2½, 60 cts. per cell.

LIBERAL DISCOUNTS.

AMERICAN CARBONS.

Burn them up and burn them down,

That is what they are made for. Some Carbons are not fit to burn in an arc lamp, they are more suitable for the furnace. The American Carbon is a success. Our customers say so and keep right on using them. And the prices—you ought to know about them. Write us.

GEO. G. CARTER & CO.,

1563 Monadnock Block,

CHICAGO.

TRADE P&B MARK — WATERPROOF PRESERVATIVE

Took HIGHEST MEDAL

FROM ALL COMPETITORS

At the World's Fair, Chicago.

Manufactured only by

THE STANDARD PAINT CO., 2 Liberty Street, NEW YORK.

Chicago Office, 871 The Rookery.

General Western Agents:

METROPOLITAN ELECTRIC CO., 186 and 188 Fifth Avenue, CHICAGO, ILL.

Pivotal Boston Trolleys,
Anderson Steel Trolley Poles,
West End Trolley Wheels,
Trolley Repair Parts—All in Stock.

Correspondence Solicited.

Man'f'd by ALBERT & J. M. ANDERSON, 289 to 293 A St., Boston, Mass.

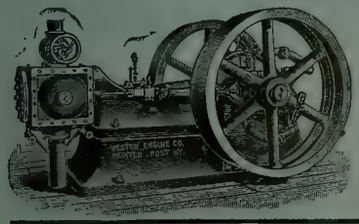
GRAPHITE SPECIALTIES

FOR ELECTRICAL USES:

Graphite Rods of Various Lengths, from 1-5 Ohm to 100 Ohms Resistance to the inch. Graphite Boxes and Crucibles, Resisting Heats of 4,000 Degrees. Inquiries Gladly Answered.

JOS. DIXON CRUCIBLE CO., Jersey City, N. J.

WESTON ENGINES.



HIGH PRESSURE BOILERS.

COMPLETE POWER PLANTS.

ESTIMATES AND DRAWINGS SUBMITTED.

WESTON ENGINE CO., Painted Post, N. Y.

REPRESENTATIVES:
Julian Scholl & Co., 126 Liberty St., New York.
Geo. D. Hoffman, 82 Lake St., Chicago, Ill.
H. M. Scipio & Co., 3d & Arch Sts., Philadelphia.

HOW THE

GREAT FAIR

Was Opened!

—o—

THE PRESIDENT PRESSED THE VICTOR KEY AND THE EXETER DRY BATTERY DID THE REST!

—o—

The Victor Telegraph Key and the Exeter Dry Battery were both selected to open the World's Columbian Exposition.

Send for Sample of the Victor Key, Price $2.50.

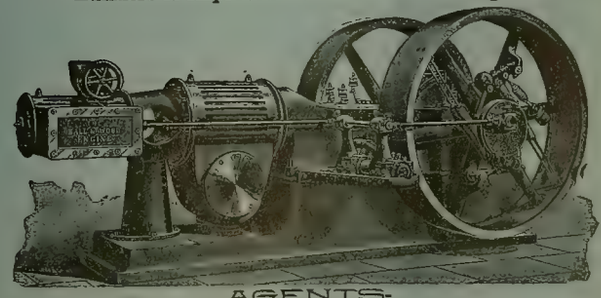
Send for Sample of Exeter Dry Battery, Price 80c.

Samples Delivered, Transportation Prepaid.

THE E. S. GREELEY & CO., 5 and 7 DEY STREET, NEW YORK.

THE BALL & WOOD COMPANY,

Builders of Improved Automatic Cut-off Engines.



AGENTS:

Chicago Office, Home Ins. Bldg., W. B. Pearson, Manager.
Stern & Silverman, 707 Arch St., Philadelphia, Pa.
Southern Engineering Co., Louisville, Ky.
Geo. M. Kenyon, Endicott Arcade, St. Paul, Minn
James & Company, Chattanooga, Tenn

THE NEW INCANDESCENT ARC LIGHT.

Something New.

THE ALLEN SOLDERING STICK,

A Substitute for Resin, Acids and Soldering Salts.

ALWAYS READY FOR USE.

Makes a joint that will not corrode or in any way affect the surrounding insulation, in less time than it can be made in any other way.

Saves more than its cost in no time.
Cheaper than Acids or Salts.
No Waste—No Breakage.

The ALLEN SOLDERING STICK is undoubtedly the greatest improvement that has ever been made in a soldering compound. It is destined to entirely displace acids, resins or salts, as it possesses the combined advantages of all of them with an added convenience and at a less price.

Send Twenty-five Cents for a Sample Stick.

It is put up regularly in round sticks six inches long and one inch in diameter, in individual wooden boxes. It is applied by simply rubbing the stick on the joint, when heated, making a perfect joint without in any way corroding the wire or affecting the insulation. There is no waste as the stick can be used down to the last particle. It can be carried about in the grip or pocket without danger of breakage, and is always ready for use.

Try it and you will use nothing else. It is to your interest to test the merits of the above claims.

One stick is more than equal to a half pound of soldering salts.

ELECTRIC APPLIANCE COMPANY,

Exclusive Manufacturers, **242 Madison Street, CHICAGO.**

WIRT INDICATORS.

I have purchased the Wirt Laboratory from the assignee of the Ansonia Electric Co., together with a large stock of Wirt Indicators; these instruments are all new and in first-class condition. They include indicators for direct and alternating current ranging from 10 to 1,000 amperes and from 2½ to 3,000 volts. While this stock lasts I will make extremely low prices. Apply to the undersigned or to your regular dealer

—— MANUFACTURERS OF ——

DIRECT CURRENT MULTIPOLAR DYNAMOS AND GENERATORS.

These machines are constructed with outside revolving armatures, without and with special commutator, as desired. They have proved remarkably efficient and economical. Used largely in European Central Stations. They are slow-speed machines, made for direct connection to engine without belting, and in sizes from 20 H. P. to 1,500 H. P.

HIGH-SPEED BELTED SIEMENS DYNAMOS
Are copied extensively in this country as "Drum Type." We are building these machines in sizes from 1 H. P. to 150 H. P.

ALTERNATING AND MULTIPHASE CURRENT DYNAMOS
With laminated field and armature, in sizes from 1 H. P to 4,000 H. P., for belted or direct coupling.

MOTORS
Of every speed for direct, alternating or multiphase current, in sizes from 1-10 H. P. up to 4,000 H. P. Durable and economical in operation.

SIEMENS BAND LAMPS
For direct and alternating current, for constant potential and series machines.

SIEMENS ARC LIGHT CARBONS
With either solid or soft cores, which are the most economical in the world and give a steady light.

ALL INSTRUMENTS
Requisite for the regulation of electric apparatus; also the Siemens Voltmeters and Ammeters and Automatic devices made in Berlin.

THE

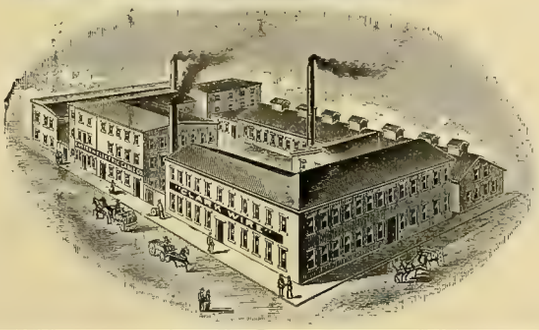
"CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

MIAMISBURG, O.

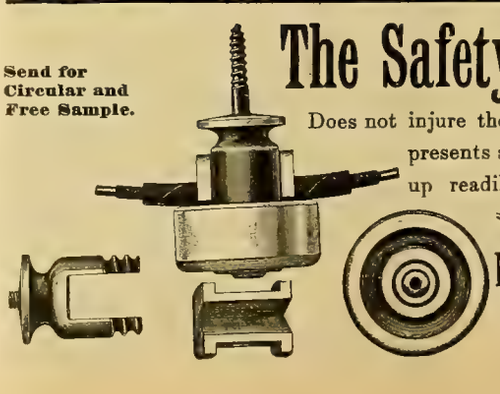
Imperial Dry Battery.

Guaranteed the best Dry Battery ever made.
Internal short circuiting or local action is eliminated.
Will not deteriorate when not doing work.
Will hold its first value over long periods of time.
Internal resistance, small, high and constant, E. M. F.
Will not run down or die on the shelf.
No bursting of seals or oozing of salts from the top.

ALL BATTERIES GUARANTEED. **SEND FOR CATALOGUE.**

Send for Circular and Free Sample.

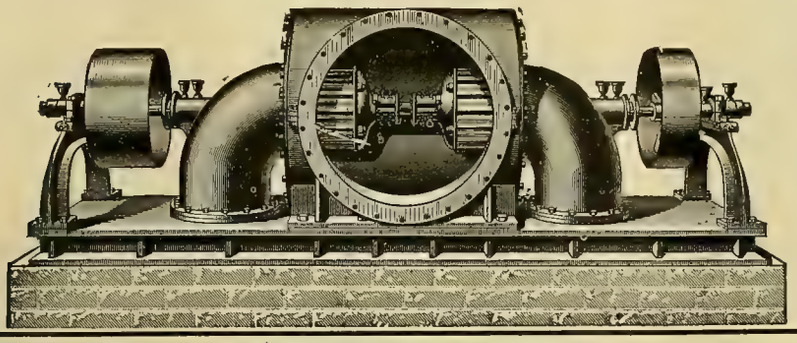
The Safety Insulator



Does not injure the insulation of the wire, presents a neat appearance, is put up readily without the use of screwdriver or other tool.

McLeod, Ward & Co.,
91 Liberty Street,
NEW YORK.

VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high Speed and great Efficiency,** and **large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

SEND FOR CATALOGUE AND PARTICULARS.

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of 12 inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast-Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

STILWELL & BIERCE MFG. CO., DAYTON, OHIO.

ARE YOU IN THE SWIM? We are; and are just luxuriating in the warmth of the encomiums received regarding our goods. If you are not, do not hesitate any longer to take a dive in and swim along with us. We will stand by you, take our word for it. If you are but a beginner, no matter; we can put you on a line that will enable you to calmly swim along against the dashing breakers of opposition. We are known as the LAW BATTERY COMPANY, and will be found on the beach at 85 John St., New York, ready at any time with our line of Double Cylinder, Carbon and Clay Porous cup cells, and Battery materials in general.

THE McCORMICK TURBINE,

On Vertical or Horizontal Shaft,

Especially Adapted for Electric Work.

Gives more power as to diameter with a higher percentage of useful effect than any other water-wheel heretofore made. All sizes, right and left hand, are built from patterns perfected under systematic tests in the Holyoke Testing Flume.

Parties having power plants which are unsatisfactory, and those contemplating the improvement of powers, will find it to their interest to confer with me, **as I am willing to guarantee results where others have failed, no matter what make of turbine has been in use. STATE REQUIREMENTS AND SEND FOR CATALOGUE.**

The "Ideal" Storage Battery

For all Classes of Work where Light and Power are Required.

NORTH AMERICAN PHONOGRAPH COMPANY.
CHICAGO, ILL., September 13, 1893.

MESSRS. BRADBURY-STONE STORAGE BATTERY CO., Lowell, Mass.

GENTLEMEN:—We take a great deal of pleasure in being able to laud the merits of the Bradbury-Stone Ideal Storage Battery for use in connection with the Phonograph. Within the last few months we have purchased in all several hundred of your cells, and have shipped them on orders to various parts of the country in almost every conceivable manner. They have withstood the most severe tests, and have in all cases given entire satisfaction.

Yours truly, THOS. R. LOMBARD, General Manager.

Thousands in use all over the country.

INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

CONTENTS.

PART I.—Polyphase Currents.

CHAPTER 1....Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors. —Synchronizing Motors.—Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31....."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

PART III.—Miscellaneous Inventions and Writings.

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by

An Honest Lamp, Honestly Made.

THE OLD RELIABLE

PACKARD LAMP.

5 to 500 Candle Power.

See that your lamps bear our registered trade mark.

NEW YORK & OHIO CO., - Warren, Ohio.

MAKERS OF PACKARD LAMPS.

ALFRED F. MOORE,

MANUFACTURER OF

INSULATED ELECTRIC WIRE,

FLEXIBLE CORDS and CABLES.

200 and 202 North Third Street. - - PHILADELPHIA, PA.

TRADE MARK. E A A AETNA

Aetna Railway Insulators, Anderson Line Material,

Manufactured solely by ALBERT & J. M. ANDERSON, 289 to 293 A Street, Boston, Mass.

Correspondence Solicited.

DRY BATTERIES.

BEST OF ALL IS **THE STANDARD,**

Made by J. H. BUNNELL & CO., 76 Cortlandt St., New York.

Best Construction and Ingredients. Strongest, most Durable and Reliable. Size 6x2½, 60 cts. per cell.

LIBERAL DISCOUNTS.

AMERICAN CARBONS.

Burn them up and burn them down,

That is what they are made for. Some Carbons are not fit to burn in an arc lamp, they are more suitable for the furnace. The American Carbon is a success. Our customers say so and keep right on using them. } And the prices—you ought to know about them. Write us.

GEO. G. CARTER & CO.,

1563 Monadnock Block,

CHICAGO.

DELAWARE HARD FIBRE COMPANY.

THE BEST ORIGINAL SUBSTITUTE FOR HARD RUBBER.

Adopted by the leading Electric Companies of the United States and Europe.

A More Satisfactory Insulator at Half the Cost.

Send for Our Illustrated Catalogue.

FACTORY, Wilmington, Del., St ..re. 15 Long Lane, LONDON.

CHICAGO AGENT, J. L. Thomps .n, 107 Dearborn Street.

D H F

BEST. CHEAPEST.

POWERS' Perfect Arc Cut-Out.

GUARANTEED FREE FROM DEFECTS.

Meets all requirements Board of Underwriters. Special prices to Central Stations. Write for prices.

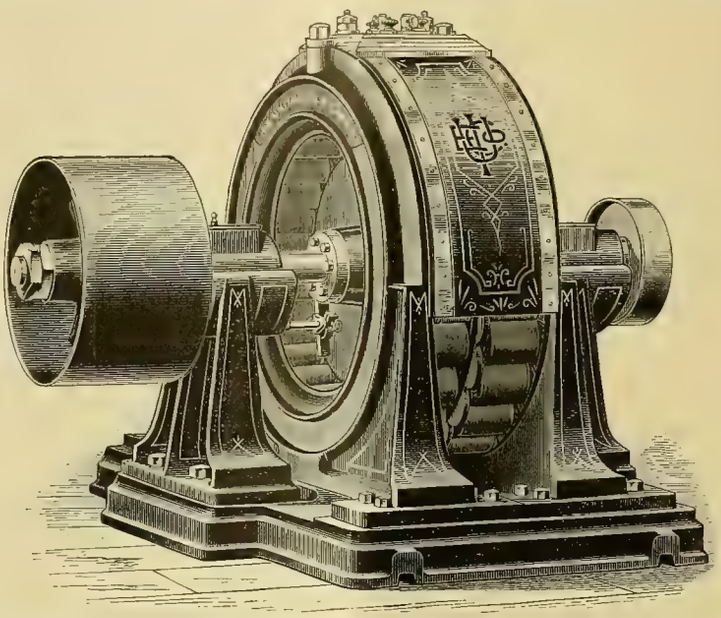
THE

United Electric Improvement Company,

838 DREXEL BUILDING, PHILADELPHIA,

Desire to correspond with responsible parties actively engaged in the sale of electric lighting apparatus in the following cities, viz.:

New York,
San Francisco,
Omaha,
Seattle,
New Orleans,
Cincinnati,
Boston,
Los Angeles,



St. Paul,
Galveston,
Atlanta,
Baltimore,
Montreal,
Salt Lake City,
Denver,
San Antonio,
Jacksonville.

TO THOSE DESIROUS OF TAKING UP THE SALE OF ALTERNATING CURRENT APPARATUS OF UNDOUBTED MERIT AN OPPORTUNITY IS OFFERED.

Don't make a Alternating Arc investigating

By Buying any Lamp before the

MON-ARC

Everything about it is of the very best. Brass Frame, Brass Shell, Brass Cap, Brass Rods. No tin or stovepipe iron. It combines unequaled simplicity with absence of all objectionable features heretofore present in alternating lamps. It is a **NON-STICKER** that central station men and lamp trimmers will be **STUCK** on because they don't have to **MONKEY** with it every few days, taking it down to clean and oil. Lamps for all systems. We guarantee every lamp. Write for prices.

Something New.

THE ALLEN SOLDERING STICK,

A Substitute for Resin, Acids and Soldering Salts.

ALWAYS READY FOR USE.

Makes a joint that will not corrode or in any way affect the surrounding insulation, in less time than it can be made in any other way.

Saves more than its cost in no time.
Cheaper than Acids or Salts.
No Waste—No Breakage.

The ALLEN SOLDERING STICK is undoubtedly the greatest improvement that has ever been made in a soldering compound. It is destined to entirely displace acids, resins or salts, as it possesses the combined advantages of all of them with an added convenience and at a less price.

Send Twenty-five Cents for a Sample Stick.

It is put up regularly in round sticks six inches long and one inch in diameter, in individual wooden boxes. It is applied by simply rubbing the stick on the joint, when heated, making a perfect joint without in any way corroding the wire or affecting the insulation. There is no waste as the stick can be used down to the last particle. It can be carried about in the grip or pocket without danger of breakage, and is always ready for use.

Try it and you will use nothing else. It is to your interest to test the merits of the above claims.

One stick is more than equal to a half pound of soldering salts.

THE

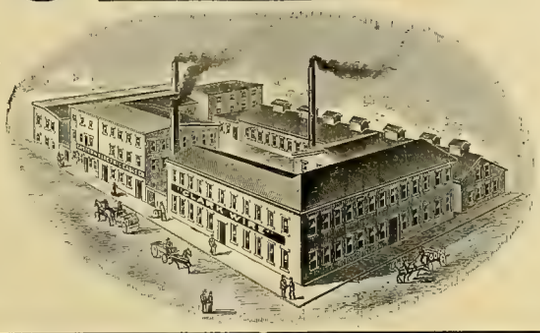
"CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

WHAT MONEY CAN EARN AND THE PEOPLE SAVE BY MEANS OF THE

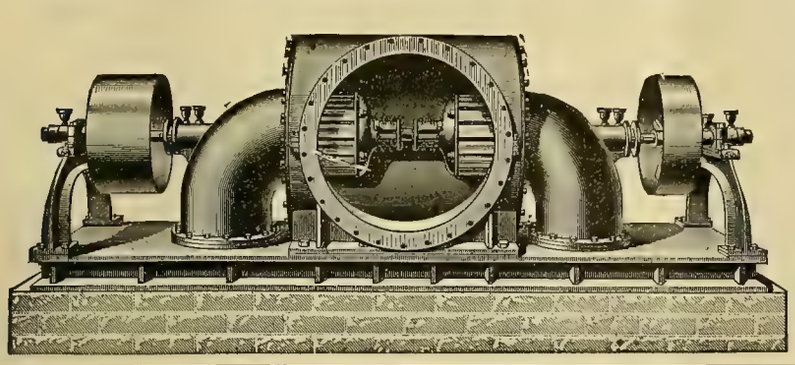
Harrison International Telephone.

This company owns Letters Patent No. 476,200, granted to E. M. Harrison May 30, 1892, and Letters Patent No. 499,108, granted to E. M. Harrison June 6, 1890, for a complete speaking telephone operated by battery; and owns Letters Patent No. 435,295, granted to William Hutson Ford August 26, 1890, for an automatic switchboard. Our patents embrace every device necesssary in the construction of a telephone plant with either manual or automatic switchboard.

Prospectuses furnished by addressing the Company at their offices,

44 and 46 Wall St., New York City.

VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high Speed and great Efficiency,** and **large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

SEND FOR CATALOGUE AND PARTICULARS.

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of 12 inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast-Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage**, and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

THE JAMES LEFFEL & CO. SPRINGFIELD, OHIO, AND NEW YORK CITY.

The Dow Adjuster

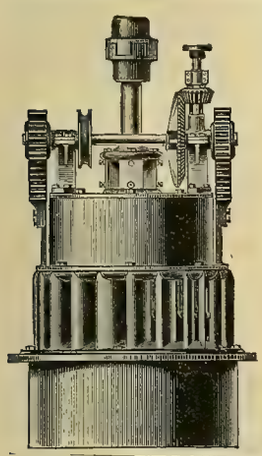
Is a thoroughly reliable mechanism for instantly raising or lowering an electric light. The lamp can be placed at any height as easily as a window shade can be raised or lowered.

Manufactured Solely by

Dow Adjuster Co,

Box 210, Braintree, Mass.

Send for Circular.



THE McCORMICK TURBINE,

On Vertical or Horizontal Shaft,
Especially Adapted for Electric Work.

Gives more power as to diameter with a higher percentage of useful effect than any other water-wheel heretofore made. All sizes, right and left hand, are built from patterns perfected under systematic tests in the Holyoke Testing Flume.

Parties having power plants which are unsatisfactory, and those contemplating the improvement of powers, will find it to their interest to confer with me, **as I am willing to guarantee results where others have failed, no matter what make of turbine has been in use. STATE REQUIREMENTS AND SEND FOR CATALOGUE.**

S. MORGAN SMITH, York, Pa.

Estimates furnished for complete power plants and results guaranteed.

JUST OFF THE PRESS.

INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

CONTENTS.

PART I.—Polyphase Currents.

CHAPTER 1....Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors.—Synchronizing Motors.—Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31....."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

PART III.—Miscellaneous Inventions and Writings.

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by

YOU NEED THESE BOOKS.

NEW
DYNAMO TENDERS' HAND-BOOK.
By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. 138 Engravings.

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.
By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.
By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.
By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS.
"TRAMS."
Their Construction, Operation and Maintenance.
By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. Profusely Illustrated.

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.
By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY ... OF ... ELECTRICAL WORDS,
TERMS AND PHRASES.
By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. 750 Illustrations.

PRICE, $5.00.

THE ELECTRIC MOTOR AND ITS APPLICATIONS.
By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT
OF
DYNAMOS AND MOTORS.
By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS
FOR THE USE OF
Engineers and Architects.
By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.
By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. Profusely Illustrated.

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.
Experiments with Alternate Currents.
By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.
By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.
By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

ELECTRIC APPLIANCE COMPANY,

ELECTRICAL SUPPLIES. 242 Madison Street. CHICAGO.

ALFRED F. MOORE,

MANUFACTURER OF

INSULATED ELECTRIC WIRE,

FLEXIBLE CORDS and CABLES.

200 and 202 North Third Street. - - PHILADELPHIA, PA.

DRY BATTERIES.

BEST OF ALL IS **THE STANDARD,**

Made by J. H. BUNNELL & CO., 76 Cortlandt St., New York.

Best Construction and Ingredients. Strongest, most Durable and Reliable. Size 6x2½, 60 cts. per cell.

LIBERAL DISCOUNTS.

AMERICAN CARBONS.

Burn them up and burn them down,

That is what they are made for. Some Carbons are not fit to burn in an arc lamp, they are more suitable for the furnace. The American Carbon is a success. Our customers say so and keep right on using them. And the prices—you ought to know about them. Write us.

THE

"CLARK" WIRE.

TRADE MARK.

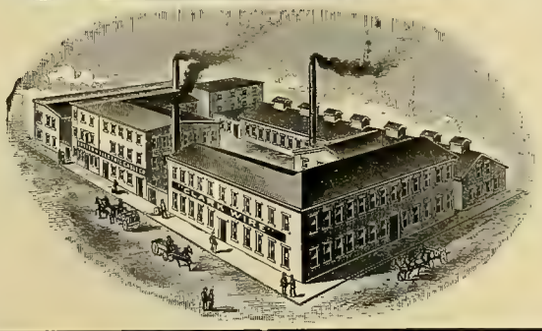
For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,

GREAT WESTERN MFG. CO.,

Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

WHAT MONEY CAN EARN AND THE PEOPLE SAVE BY MEANS OF THE

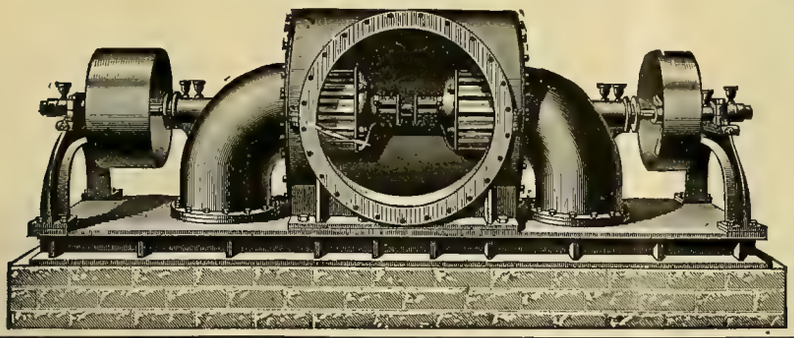
Harrison International Telephone.

This company owns Letters Patent No. 476,200, granted to E. M. Harrison May 30, 1892, and Letters Patent No. 499,108, granted to E. M. Harrison June 6, 1890, for a complete speaking telephone operated by battery; and owns Letters Patent No. 435,295, granted to William Hutson Ford August 26, 1890, for an automatic switchboard. Our patents embrace every device necessary in the construction of a telephone plant with either manual or automatic switchboard.

Prospectuses furnished by addressing the Company at their offices,

44 and 46 Wall St., New York City.

VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high Speed and great Efficiency,** and **large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

SEND FOR CATALOGUE AND PARTICULARS.

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of 12 inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast-Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

STILWELL & BIERCE MFG. CO., DAYTON, OHIO.

ACCEPTED.

We are puzzled to know what connection our artist could see between this cut and our line of business, but as we were never there ourselves, we defer to him. We think his thoughts ran about as follows:

We claim that for efficiency and durability our goods are unexcelled. This claim has been accepted not only by our own countrymen, but by the Asiatics and all those nations that branched out from that multitudinous throng that wandered from Asia, overspread and settled in Europe. Such being the case we **Propose** to you that you also, unknown friend, **Accept** our word and send us a trial order, feeling assured that in the end we shall have you for a steady customer. We have to offer you

WANTED.

We will pay 25 cents each for clean copies of the WESTERN ELECTRICIAN of June 18, 1892, Volume X, Number 25.

WESTERN ELECTRICIAN,
6 Lakeside Building, Chicago.

MAP OF THE UNITED STATES.

A large, handsome Map of the United States, mounted and suitable for office or home use, is issued by the Burlington Route. Copies will be mailed to any address on receipt of twelve cents in postage by P. S. EUSTIS, Gen'l Pass. Agent, C. B. & Q. R. R., Chicago, Ill.

TELEPHONES!!

This company is manufacturing

A Compound Magneto Telephone

which it sells outright under a guarantee both as to efficiency and as against infringement of patents.

It talks as well over one hundred miles as any other Telephone talks over one mile.

This company is also prepared to fully equip Telephone exchanges, (furnishing everything from the telephone to the wire and poles). Private lines, Factory plants, etc., and do all kinds of construction work.

Send for circulars and price lists.

WESTERN TELEPHONE CONSTRUCTION CO.,

539, 540 and 541 Monadnock Blk., Chicago, Ill.

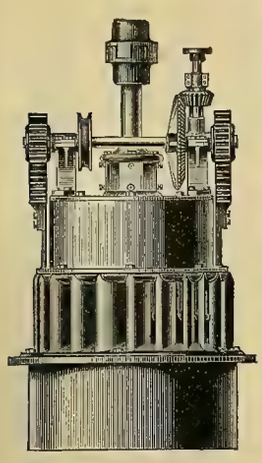
GENERAL INCANDESCENT ARC LIGHT COMPANY,

NEW YORK.

169 Adams Street, CHICAGO.

S. BERGMANN, President.

572 to 578 First Avenue, NEW YORK.



THE McCORMICK TURBINE,

On Vertical or Horizontal Shaft,
Especially Adapted for Electric Work.

Gives more power as to diameter with a higher percentage of useful effect than any other water-wheel heretofore made. All sizes, right and left hand, are built from patterns perfected under systematic tests in the Holyoke Testing Flume.

Parties having power plants which are unsatisfactory, and those contemplating the improvement of powers, will find it to their interest to confer with me, **as I am willing to guarantee results where others have failed, no matter what make of turbine has been in use. STATE REQUIREMENTS AND SEND FOR CATALOGUE.**

S. MORGAN SMITH, York, Pa.

Estimates furnished for complete power plants and results guaranteed.

SPECIAL ANNOUNCEMENT.

"THE HELIOS"

SPECIAL ALTERNATING ARC LAMP

Can be run three in series from 105 volt secondary circuit.

STANDARD ALTERNATING ARC LAMPS

Can be run in multiple from 50 or 100 volt secondary circuits by Spencer Economy Coils.

No Special Transformers Necessary. No Dead Resistance Required. No Change of Wiring.

SPECIAL NOTICE.

Helios Carbons will be sold only with the Helios Lamp. The Helios is the only lamp that has a legal right to use the reflector plate between the standards, without which one-half of the light is wasted.

HELIOS ELECTRIC CO., 1310 Filbert St., Philadelphia.

JUST OFF THE PRESS.

INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

CONTENTS.

PART I.—Polyphase Currents.

CHAPTER 1....Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors. —Synchronizing Motors —Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31....."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

PART III.—Miscellaneous Inventions and Writings.

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by

ELECTRICIAN PUBLISHING CO., 6 Lakeside Building, Chicago.

ELECTRICITY FOR ENGINEERS.

Part I, 268 Pages, $2.00. Part II, 156 Pages, $1.00.

WHEN ORDERED TOGETHER PRICE IS $2.50.

Both Works Profusely Illustrated.

☛ **Just the Work for Engineers, Electricians, Dynamo Tenders, etc.**

PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current—How Produced—Induction—Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting—Testing—Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel—Multiple Series—Multiple Series Cut-Out—Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators—Brushes—Different Styles of Brushes—Double Brushes—Single Brushes—Troubles with Commutators and Brushes—Correct Position of Brushes—Sparking at Brushes—Care of Brushes and Commutators—Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation—Dynamo—Extra Brush—Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from Those Used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation—Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

Orders Promptly Filled on Receipt of Price. Postage Prepaid.

YOU NEED THESE BOOKS.

NEW
DYNAMO TENDERS' HAND-BOOK.

By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. 138 Engravings.

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.

By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.

By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.

By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS. "TRAMS."

Their Construction, Operation and Maintenance.

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. Profusely Illustrated.

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.

By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY ... OF ... ELECTRICAL WORDS, TERMS AND PHRASES.

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. 750 Illustrations.

PRICE, $5.00.

THE ELECTRIC MOTOR AND ITS APPLICATIONS.

By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT OF DYNAMOS AND MOTORS.

By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS FOR THE USE OF Engineers and Architects.

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. Profusely Illustrated.

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.

Experiments with Alternate Currents.

By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

MANUFACTURED BY
The Indiana Rubber & Insulated Wire Co.,
Office, Marion, Ind. Factory, Jonesboro, Ind.
Boston Office, 220 Devonshire St., New York Office, 32 Frankfort St., } Frank W. Brigham, Mgr.

"A LIGHT SO BRIGHT," ETC.

IS PRODUCED ONLY BY THE
Packard High Grade Lamp.
All voltages, candle powers and sockets carried in stock in Chicago by the
ELECTRIC APPLIANCE COMPANY,
WESTERN AGENTS,
ELECTRICAL SUPPLIES. 242 Madison Street, CHICAGO.

ALFRED F. MOORE,

MANUFACTURER OF
INSULATED ELECTRIC WIRE,
FLEXIBLE CORDS and CABLES.
200 and 202 North Third Street. - - PHILADELPHIA, PA.

Aetna Railway Insulators,
Anderson Line Material,
Manufactured solely by ALBERT & J. M. ANDERSON,
289 to 293 A Street, Boston, Mass.
Correspondence Solicited.

DRY BATTERIES.

BEST OF ALL IS **THE STANDARD,**
Made by J. H. BUNNELL & CO., 76 Cortlandt St., New York.
Best Construction and Ingredients. Strongest, most Durable and Reliable. Size 6x2½, 60 cts. per cell.
LIBERAL DISCOUNTS.

AMERICAN CARBONS.

Burn them up and burn them down,
That is what they are made for. Some Carbons are not fit to burn in an arc lamp, they are more suitable for the furnace. The American Carbon is a success. Our customers say so and keep right on using them. { And the prices—you ought to know about them. Write us.

OKONITE TRADE MARK

173 - 175 Adams St., Chicago.

OKONITE TRADE MARK

It is Accomplished!

We take especial pleasure in announcing to our friends, and the general electrical trade, that we have leased the elegant buildings, Nos. 173 and 175 Adams Street, (north side, between La Salle Street and Fifth Avenue,) and for several weeks have had workmen busy remodeling the interior and fitting up the several floors in a manner to best adapt the place to the transaction of our business.

We now occupy the new premises; we have moved our *Lares* and *Penates* into this re-constructed edifice, and already begin to feel at home.

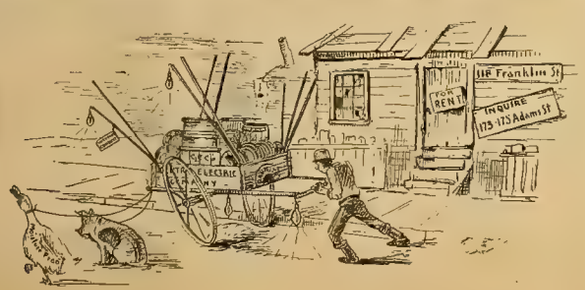
"CRAMPED."

For many months we have been seriously cramped for room. Our facilities for taking care of the increasing volume of trade has been very far from satisfactory; however, in this new domicile, we intend to have every thing that can be of value and assistance to the rapid and systematic ordering of work. We hope that the convenient and **perfectly arranged offices, capacious and well-lighted salesrooms, shipping rooms, and the immense storage area,** will not only result to our advantage, but to the good and pleasure of each one of our customers.

It may seem hackneyed, superfluous and commonplace, but we wish to add that we shall be delighted to see as many of our friends and patrons as can make it convenient to drop in on us at the new store.

"DELIGHTED."

We believe that we can truthfully say that no other Electrical Establishment in the United States can equal our present location in point of size, equipment, amount of stock carried, or in fact in any way approach us, **but come and judge for yourself.**



Remember the new address:

173-175 Adams Street.

THE

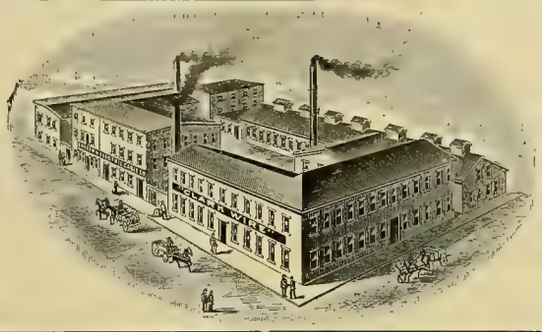
"CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

Sleepers Between Chicago and Milwaukee.

The Chicago, Milwaukee & St. Paul Railway is now running sleeping cars with drawing rooms on night trains between Chicago and Milwaukee. Sleepers can be taken in Union Passenger Station any time between 9:30 and midnight, train leaving Chicago at 3:00 a. m., arriving at Milwaukee at 5:15 a. m., passengers remaining in sleeper until 7:30 a. m. Similar arrangements Milwaukee to Chicago. Berth rate $1.50. For further particulars, for tickets and berths, apply at City Ticket Office, 207 Clark St. (Telephone Main 2190), or at Ticket Office, Union Passenger Station.

THE WONDERFUL

D'Unger Telephone.

Highly Important to Telephone Users.

BEWARE OF INFRINGING!

The D'Unger Long Distance Telephone (the "Far-Away Talker") can now be had for use in Telephone Exchanges on a small annual royalty, and **on no other terms**. It is constructed under numerous patents, especially **Patent No. 390,575**, granted Oct. 2, 1888, which is not only the **first**, but **the only undisputed and indisputable valid patent granted for an All-Carbon Multiple-Contact Microphonic Telephone Transmitter.** All all-carbon multiple-contact telephone transmitters built without or under patents granted since Oct. 2, 1888, are **infringements upon Patent No. 390,575**—a fact to be borne in mind by persons contemplating the use of Telephones.

The "D'Unger" is the only self-cleaning telephone in the world. It sends speech one (1) mile or five thousand (5,000) miles in a perfectly clear manner; can be operated at half the ordinary expense; is always in order, and has for its Receiver a Patent Compound Magneto, making but **one magnetic field**. It has likewise Paul D'Unger's Patent Diaphragm Regulator, which prevents the words from running together. As a whole it is complete, cannot be surpassed, and has no equal. Pronounced by all unprejudiced electricians to be the **Peer of Telephones.** Address

D'Unger Long-Distance Telephone Co.,
Palmer House, CHICAGO, ILL.

JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage**, and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

THE JAMES LEFFEL & CO. SPRINGFIELD, OHIO, AND NEW YORK CITY.

The Dow Adjuster

Is a thoroughly reliable mechanism for instantly raising or lowering an electric light. The lamp can be placed at any height as easily as a window shade can be raised or lowered.

Manufactured Solely by

Dow Adjuster Co,

Box 210, Braintree, Mass.

JUST OFF THE PRESS.

INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

CONTENTS.

PART I.—Polyphase Currents.

CHAPTER 1....Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors. —Synchronizing Motors —Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31....."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

PART III.—Miscellaneous Inventions and Writings.

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by

ELECTRICIAN PUBLISHING CO., 6 Lakeside Building, Chicago.

Don't make a Alternating Arc investigating

By Buying any Lamp before the

MON-ARC

Everything about it is of the very best. Brass Frame, Brass Shell, Brass Cap, Brass Rods. No tin or stovepipe iron. It combines unequaled simplicity with absence of all objectionable features heretofore present in alternating lamps. It is a **NON-STICKER** that central station men and lamp trimmers will be **STUCK** on because they don't have to **MONKEY** with it every few days, taking it down to clean and oil. Lamps for all systems. We guarantee every lamp. Write for prices.

NOW READY.

ELECTRIC TRANSMISSION HAND-BOOK.

Lieut. F. B. Badt's latest addition to our famous hand-book series, of which 30,000 copies have been sold. The new book deals in the author's well-known practical style with all the problems of Electric Power Transmission.

NOW READY. PRICE $1.00.

ELECTRICIAN PUBLISHING CO., 6 Lakeside Building, CHICAGO.

YOU NEED THESE BOOKS.

NEW DYNAMO TENDERS' HAND-BOOK.

By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. 138 Engravings.

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.

By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.

By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.

By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS. "TRAMS."

Their Construction, Operation and Maintenance.

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. Profusely Illustrated.

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.

By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY ... OF ... ELECTRICAL WORDS, TERMS AND PHRASES.

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. 750 Illustrations.

PRICE, $5.00.

THE ELECTRIC MOTOR AND ITS APPLICATIONS.

By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT OF DYNAMOS AND MOTORS.

By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS FOR THE USE OF Engineers and Architects.

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. Profusely Illustrated.

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.

Experiments with Alternate Currents.

By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

Dictionary of Electrical Words, Terms and Phrases.

By EDWIN J. HOUSTON, A. M.

562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.

This Dictionary includes 5,000 **distinct Words, Terms and Phrases**. Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

The Scheme of Treatment is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

DRY BATTERIES.

BEST OF ALL IS THE STANDARD,

Made by J. H. BUNNELL & CO., 76 Cortlandt St., New York.

Best Construction and Ingredients. Strongest, most Durable and Reliable. Size 6x2½, 60 cts. per cell. LIBERAL DISCOUNTS.

AMERICAN CARBONS.

Burn them up and burn them down,

That is what they are made for. Some Carbons are not fit to burn in an arc lamp, they are more suitable for the furnace. The American Carbon is a success. Our customers say so and keep right on using them. And the prices—you ought to know about them. Write us.

GEO. G. CARTER & CO.,

1563 Monadnock Block,
CHICAGO.

TRADE MARK. P&B. WATERPROOF PRESERVATIVE. MARK.

Took HIGHEST MEDAL

FROM ALL COMPETITORS
At the World's Fair, Chicago.

Manufactured only by
THE STANDARD PAINT CO., 2 Liberty Street, NEW YORK.

HORNBERGER ELECTRIC MFG. CO., ELKHART, IND.

ASSIGNEE'S SALE.

Notice is hereby given that the undersigned Assignee will receive bids in writing for the entire unsold stock of The Ansonia Electric Company, insolvent, or any portion thereof, situated in Cook County, Illinois; also for the book accounts and bills receivable; also for the good will, electrotypes, catalogues, and all other property of said company, situated in Cook County, Illinois.

Bids may be made for all or any part of the foregoing items, or for any part of the said property. Bids will be received at the office of the said Assignee, No. 102 Michigan Avenue, Chicago, Illinois, until 12:00 o'clock noon, May 16, 1894.

The stock on hand alone is estimated to be worth at forced sale prices, at least $20,000. Lists of stock and the stock itself may be seen at the above address, and lists of the larger part of the stock will be mailed to anyone on application. A certified check must accompany each bid for 10 per cent. of the bid, which will be returned to the bidder if the bid is not accepted. Terms cash. All bids subject to approval by the County Court of Cook County. Bids have already been received which will be accepted if no better shall be offered. Write us for information, which will be cheerfully given by mail or otherwise, on application.

J. B. WALLER, Assignee.

Helios Electric Co.
Philadelphia Penn
Gentlemen;
In regard to the Helios Lamps we have in use on our Circuit Circuit will say, We now have 26. 2000 C.P. Helios Lamps running on our streets and Giving Good Satisfaction, The first installation of 17 Lamps was made subject to acceptance by the City Council, and before they would accept the lights, they had an Expert test and report made, The Lamps was sustained as to Candle Power and General efficency, & the result was an order for 8 more Lights by the City and 1 by the County on Court House Grounds
They give a very Clear Steady white light, entirely free from the flashing and dying out of the ordinary Circuit Current arc Lamp.
Yours Truly
Barnes Bros

S' S' sh! Everybody

is moving. If you took the time to stand around Chicago streets this week, you'd think all creation was *moving*. Moving from everywhere to some place. **We've moved.** We got up early last week, took Time by the forelock and hustled.

That is what we want to impress upon the convolutions in your dome of thought. We want to get this new address tangled in the skein of your reveries,

173-175 Adams Street,

Adams Street; um, yes; named after John Quincy Adams—Patriot, Statesman, Diplomatist, Scholar, Sage.

But about this building of ours—if we had consulted an architect, Burnham, maybe, and said:

"Look here, Burnham, old man,
(Jess let up on Carlisle fer a while,)
We want you to draw and figger and plan
And get us up the best building you can."
And he'd done it, we don't believe, by jing!
That he'd made a single thing
That 'ud a suited us better,
Jess naturally fitted, square to the letter.

We are in the very heart of the business district; convenient to banks, express offices, depots; one block from post-office, adjacent to other towering hives of business; we are right in the buzz of the wheels of trade and propose to do some of the bumbling ourselves. While we were fixing up we arranged special departments for our leading specialties: **Helios Arc Lamps, Interior Conduit, Okonite Wire, Pharos Incandescent Lamps,** and a **raft** of other things which we will float into notice in proper season.

Call around and shake hands with us or send your regrets by mail.

Central Electric Co.,

173-175 ADAMS STREET, · · CHICAGO.

FORT WAYNE ELECTRIC CO.,

FORT WAYNE, IND.,

MANUFACTURERS OF

ELECTRICAL MACHINERY

UNDER THE PATENTS OF JAMES J. WOOD.

For Arc Lighting, Direct Current Incandescent Lighting, Alternating Current Incandescent Lighting, Power Transmission either by Direct or Alternating Currents.
Arc Lamps for Constant Potential Alternating or Railway Circuits.

LOW PERIOD DIRECT CONNECTED ALTERNATORS.

The new "WOOD" Transformers have the highest efficiency and best regulation of any yet produced. They are easy to install, light weight and very handsome in appearance.
Parties requiring Transformers would do well to get our estimates before purchasing.

Don't make a Alternating Arc investigating

By Buying any Lamp before the

MON-ARC

Everything about it is of the very best. Brass Frame, Brass Shell, Brass Cap, Brass Rods. No tin or stovepipe iron. It combines unequaled simplicity with absence of all objectionable features heretofore present in alternating lamps. It is a **NON-STICKER** that central station men and lamp trimmers will be **STUCK** on because they don't have to **MONKEY** with it every few days, taking it down to clean and oil. Lamps for all systems. We guarantee every lamp. Write for prices.

THE

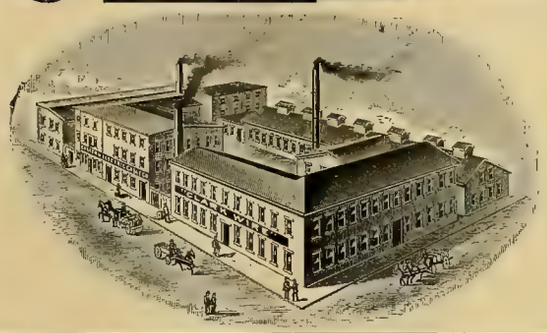
"CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

THE WONDERFUL

D'Unger Telephone.

Highly Important to Telephone Users.

BEWARE OF INFRINGING!

The D'Unger Long Distance Telephone (the "Far-Away Talker") can now be had for use in Telephone Exchanges on a small annual royalty, and **on no other terms**. It is constructed under numerous patents, especially **Patent No. 390,575**, granted Oct. 2, 1888, which is not only the **first**, but **the only undisputed and indisputable valid patent granted for an All-Carbon Multiple-Contact Microphonic Telephone Transmitter.** All all-carbon multiple-contact telephone transmitters built without or under patents granted since Oct. 2, 1888, are **infringements upon Patent No 390,575**—a fact to be borne in mind by persons contemplating the use of Telephones.

The "D'Unger" is the only self-cleaning telephone in the world. It sends speech one (1) mile or five thousand (5,000) miles in a perfectly clear manner; can be operated at half the ordinary expense; is always in order, and has for its Receiver a Patent Compound Magneto, making but **one magnetic field**. It has likewise Paul D'Unger's Patent Diaphragm Regulator which prevents the words from running together. As a whole it is complete, cannot be surpassed, and has no equal. Pronounced by all unprejudiced electricians to be the **Peer of Telephones.** Address

D'Unger Long-Distance Telephone Co.,
Palmer House, CHICAGO, ILL.

The "Ideal" Storage Battery

For all Classes of Work where Light and Power are Required.

NORTH AMERICAN PHONOGRAPH COMPANY.

CHICAGO, ILL., September 13, 1893.

MESSRS. BRADBURY-STONE STORAGE BATTERY CO., Lowell, Mass.

GENTLEMEN:—We take a great deal of pleasure in being able to laud the merits of the Bradbury-Stone Ideal Storage Battery for use in connection with the Phonograph. Within the last few months we have purchased in all several hundred of your cells, and have shipped them on orders to various parts of the country in almost every conceivable manner. They have withstood the most severe tests, and have in all cases given entire satisfaction.

Yours truly, THOS. R. LOMBARD, General Manager.

Thousands in use all over the country.

Dictionary of Electrical Words, Terms and Phrases.

By EDWIN J. HOUSTON, A. M.

562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

The Scheme of Treatment is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

EVERY VITAL CLAIM

EVER MADE FOR

The Stirling Water-Tube Safety Boiler

CONFIRMED IN THE FOLLOWING

WORLD'S FAIR AWARD:

UNITED STATES.

Department F.—Machinery.

1647

Exhibitor—Stirling Co., *Address* Chicago, Ill.,

Group 69 *Class*: 413.

Exhibit—Water Tube Steam Boilers.

AWARD

Furnishing steam for use of Exhibition. One of the chief characteristics lies in the simplicity and consequent low cost of construction. Boilers consist merely of four cylindrical shells or drums, connected by tubes which form major portion of heating surface. Tubes are expanded into drum, and practically the only machine work required upon entire structure is that employed upon the manhole frame in the head of each drum, which is of the simplest character. Tubes are located in a position slightly inclined from a vertical and the tendency of sediment to collect on either the exterior or interior surfaces is thereby reduced to a minimum. The large mud-drum, located below the current produced by circulation, insures quiet water in which mud, scale and other impurities may settle. Drum favorably located at bottom of rear bank of tubes for receiving deposits which require high temperature to be precipitated. Examination of these boilers in operation where water used contained large quantities of lime salts, demonstrated that a small amount of labor was required to maintain them in a clean condition, and that they operated with the highest efficiency in this most important feature and possessed marked advantage. Arrangement of division plates is such that exit for waste gases is over surfaces where the cold feed water is just entering, insuring low flue temperature. Use of a fire-brick arch covering grate enables high furnace temperature to be maintained. These boilers are proportioned so that the ratio of horse power to grate is about fifty to one, ample for economical result. Boilers exhibited show that they gave practically dry steam. Inner and outer rows of tubes slightly curved. A chain scraper is passed through when deposits form on surfaces. The tubes are accessible from outside. A single workman disconnected the four manhole plates and exposed every tube in the boiler within a period of five minutes.

Extreme simplicity and low cost of construction of water tube boilers. Excellence of design in features pertaining to fuel economy, and singular adaptability to situations requiring the use of impure feed water.

STREET LIGHTING FROM ALTERNATING CURRENT DYNAMOS.

New Prices given on Lamps, Street Fixtures, Bank Boards, Series Sockets, Poles, Meters

And all accessories for the use of SERIES LAMPS on ALTERNATING CURRENT DYNAMOS.

This system permits a PROFITABLE and SATISFACTORY method of street illumination and should be investigated by every plant using alternating current apparatus. WRITE FOR FURTHER PARTICULARS AND PRICES.

OUR SERIES LAMPS

Will show you a COMPARATIVE SAVING equal to their FIRST COST in POWER CONSUMED.

BERNSTEIN ELECTRIC COMPANY, 620 Atlantic Ave., Boston, Mass.

ASSIGNEE'S SALE.

Notice is hereby given that the undersigned Assignee will receive bids in writing for the entire unsold stock of The Ansonia Electric Company, insolvent, or any portion thereof, situated in Cook County, Illinois; also for the book accounts and bills receivable; also for the good will, electrotypes, catalogues, and all other property of said company, situated in Cook County, Illinois.

Bids may be made for all or any part of the foregoing items, or for any part of the said property. Bids will be received at the office of the said Assignee, No. 102 Michigan Avenue, Chicago, Illinois, until 12:00 o'clock noon, May 16, 1894.

The stock on hand alone is estimated to be worth at forced sale prices, at least $20,000. Lists of stock and the stock itself may be seen at the above address, and lists of the larger part of the stock will be mailed to anyone on application. A certified check must accompany each bid for 10 per cent. of the bid, which will be returned to the bidder if the bid is not accepted. Terms cash. All bids subject to approval by the County Court of Cook County. Bids have already been received which will be accepted if no better shall be offered. Write us for information, which will be cheerfully given by mail or otherwise, on application.

J. B. WALLER, Assignee.

Helios Electric Co

Philadelphia Penn'a

Gentlemen:

In regard to the Helios Lamps we have in use on our Street Circuit will say, We now have 26. 2000 C.P. Helios Lamps running on our Streets and giving good satisfaction, The first installation of 17 Lamps was made subject to acceptance by the City Council, and before they would accept the lights, they had an Expert test and report made, The Lamp was sustained as to Candle Power and General efficency, and the result was an order for 8 more Lights by the City and 1 by the County on Court House Grounds. They give a very Clear Steady white light, entirely free from the flashing and dying out of the ordinary Circuit Current arc Lamp.

Yours Truly

Barnes Bros

CHICAGO.

Moving.

Just as soon as we have this spring moving completed—it's been an awful job—and get our establishment once more in apple-pie order, we wish to have our official photographer bring his concession over and "take us" inside and out. We will have pleasure in publishing the views of our splendid habitation, so that our friends may know just how we look.

Orders Shipped Promptly.

Our stock and our shipping room is in perfect working trim and we can assure every patron that orders will receive the usual prompt and careful attention. Don't forget that we are the special agents for the **Helios Low Tension, Alternating and Direct Current Arc Lamp,** unquestionably the most perfect arc lamp in use to-day. **It is absolutely safe,** requires no special wiring, and affords to the station manager opportunities of profitably pleasing his customers which can be improved in no other way.

Special descriptive catalogue to any address.

The Helios Alternating and Direct Current Arc Lamp.

A Discourager of Hesitancy—

It occurs to us that this is a particularly happy time to encourage the perusal of our Trade Papers—especially the advertising pages—also to encourage the transmission of "orders" to the place where they will do the most good. We, at least, are interested in knowing to what extent we reach the possible buyer and in a measure to test this we call attention to the affixed Coupon, which will fully explain itself.

DISCOUNT COUPON.

This Coupon attached to any order reaching us on or before May 15, 1894, will entitle the purchaser to **an extra discount of 5 per cent.**

THE

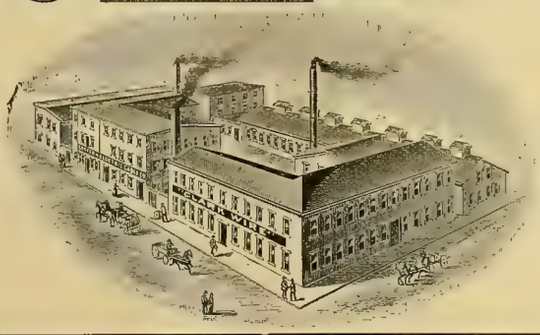
"CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

THE WONDERFUL

D'Unger Telephone.

Highly Important to Telephone Users.

BEWARE OF INFRINGING!

The D'Unger Long Distance Telephone (the "Far-Away Talker") can now be had for use in Telephone Exchanges on a small annual royalty, and **on no other terms**. It is constructed under numerous patents, especially **Patent No. 390,575**, granted Oct. 2, 1888, which is not only the **first**, but **the only undisputed and indisputable valid patent granted for an All-Carbon Multiple-Contact Microphonic Telephone Transmitter.** All all-carbon multiple-contact telephone transmitters built without or under patents granted since Oct. 2, 1888, are **infringements upon Patent No. 390,575**—a fact to be borne in mind by persons contemplating the use of Telephones.

The "D'Unger" is the only self-cleaning telephone in the world. It sends speech one (1) mile or five thousand (5,000) miles in a perfectly clear manner; can be operated at half the ordinary expense; is always in order, and has for its Receiver a Patent Compound Magneto, making but **one magnetic field** It has likewise Paul D'Unger's Patent Diaphragm Regulator, which prevents the words from running together. As a whole it is complete, cannot be surpassed, and has no equal. Pronounced by all unprejudiced electricians to be the **Peer of Telephones.** Address

D'Unger Long-Distance Telephone Co.,
Palmer House, CHICAGO, ILL.

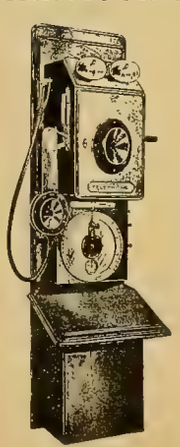
The Harrison International Telephone Co.



WHAT MONEY CAN EARN AND THE PEOPLE SAVE BY MEANS OF THE

Harrison International Telephone.

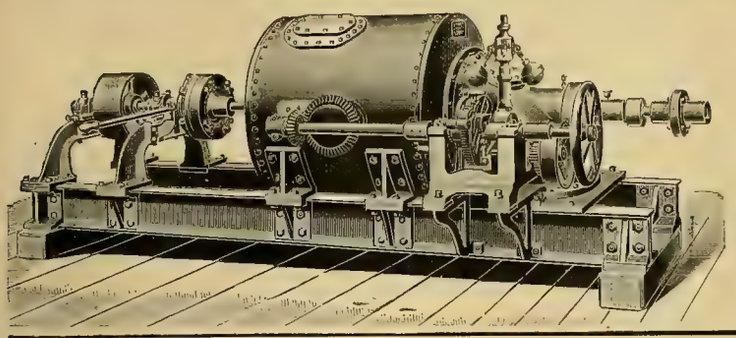
We either sell our telephones outright or lease them for a term of years.

This company owns Letters Patent No. 476,200, granted to E. M. Harrison May 30, 1892, and Letters Patent No. 499,108, granted to E. M. Harrison June 6, 1890, for a complete electric speaking telephone operated by battery; and owns Letters Patent No. 435,295, granted to William Hutson Ford August 26, 1890, for an automatic switchboard. Our patents embrace every device necessary in the construction of a telephone plant with either manual or automatic switchboard.

Prospectuses furnished by addressing the Company at their offices,

44 and 46 Wall St., New York.

VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high speed and great Efficiency,** and **Large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent. of useful effect **guaranteed. SEND FOR CATALOGUE AND PARTICULARS.**

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of of 12-inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

STILWELL & BIERCE MFG. CO., - Dayton, Ohio.

TO OUR TELEPHONE FRIENDS.

CONSULTATION.—We are large dealers in Coppers but we'll waive that point this time as we wish now to consult with you on other matters, viz :

As the resistance of the primary circuit in a telephone transmitter, i. e., coil, carbon button and contact, is very low, necessary from the fact that the changes in the current caused by talking against the diaphragm must be rapid and the flow of the current should not be impeded but assisted, we wish to ask you if this is not best accomplished by using a battery of known low internal resistance and of unchangeable resistance that the adjustment of the transmitter, when the battery is first connected up, need be the only adjustment until the battery needs renewal of the solution. Your opinion of course is in the affirmative, therefore, consult with those that use the celebrated Law Double Cylinder Cell, and they will undoubtedly advise you to use that cell and no other. It has a negative element surface of 147 sq. in. and a jar admitting of 2½ pints of solution, therefore, its holding up power must be great. It gives an ample uniform current from first to last, and does not deteriorate and thereby increase its internal resistance. Its first cost is about its only cost. Do not overlook the fact that we are large dealers in Sal Ammoniac, Zincs, Clay and Carbon Porous cup cells, Acid cells, Plunge Batteries, etc.

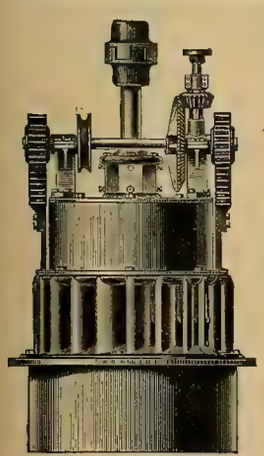
Sleepers Between Chicago and Milwaukee.

The Chicago, Milwaukee & St. Paul Railway is now running sleeping cars with drawing rooms on night trains between Chicago and Milwaukee. Sleepers can be taken in Union Passenger Station any time between 9:30 and midnight, train leaving Chicago at 3:00 a. m., arriving at Milwaukee at 5:15 a. m., passengers remaining in sleeper until 7:30 a. m. Similar arrangements Milwaukee to Chicago. Berth rate $1.50. For further particulars, for tickets and berths, apply at City Ticket Office, 207 Clark St (Telephone Main 2190), or at Ticket Office, Union Passenger Station.



THE McCORMICK TURBINE,

On Vertical or Horizontal Shaft,
Especially Adapted for Electric Work.

Gives more power as to diameter with a higher percentage of useful effect than any other water-wheel heretofore made. All sizes, right and left hand, are built from patterns perfected under systematic tests in the Holyoke Testing Flume.

Parties having power plants which are unsatisfactory, and those contemplating the improvement of powers, will find it to their interest to confer with me, **as I am willing to guarantee results where others have failed, no matter what make of turbine has been in use. STATE REQUIREMENTS AND SEND FOR CATALOGUE.**

YOU NEED THESE BOOKS.

NEW DYNAMO TENDERS' HAND-BOOK.

By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. 138 Engravings.

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.

By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.

By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.

By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS.

"TRAMS."

Their Construction, Operation and Maintenance.

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. Profusely Illustrated.

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.

By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY ... OF ... ELECTRICAL WORDS,

TERMS AND PHRASES.

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. 750 Illustrations.

PRICE, $5.00.

THE ELECTRIC MOTOR AND ITS APPLICATIONS.

By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT OF DYNAMOS AND MOTORS.

By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS FOR THE USE OF Engineers and Architects.

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. Profusely Illustrated.

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.

Experiments with Alternate Currents.

By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current—How Produced — Induction — Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting— Testing— Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel— Multiple Series — Multiple Series Cut-Out — Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators—Brushes—Different Styles of Brushes—Double Brushes—Single Brushes—Troubles with Commutators and Brushes—Correct Position of Brushes—Sparking at Brushes — Care of Brushes and Commutators — Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation — Dynamo — Extra Brush — Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from Those Used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation — Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage,** and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

Exhibit—Water Tube Steam Boilers.—.

AWARD

Furnishing steam for use of Exhibition. One of the chief characteristics lies in the simplicity and consequent low cost of construction. Boilers consist merely of four cylindrical shells or drums, connected by tubes which form major portion of heating surface. Tubes are expanded into drum, and practically the only machine work required upon entire structure is that employed upon the manhole frame in the head of each drum, which is of the simplest character. Tubes are located in a position slightly inclined from a vertical and the tendency of sediment to collect on either the exterior or interior surfaces is thereby reduced to a minimum. The large mud-drum, located below the current produced by circulation, insures quiet water in which mud, scale and other impurities may settle. Drum favorably located at bottom of rear bank of tubes for receiving deposits which require high temperature to be precipitated. Examination of these boilers in operation where water used contained large quantities of lime salts, demonstrated that a small amount of labor was required to maintain them in a clean condition, and that they operated with the highest efficiency in this most important feature and possessed marked advantage. Arrangement of division plates is such that exit for waste gases is over surfaces where the cold feed water is just entering, insuring low flue temperature. Use of a fire-brick arch covering grate enables high furnace temperature to be maintained. These boilers are proportioned so that the ratio of horse power to grate is about fifty to one, ample for economical result. Boilers exhibited show that they gave practically dry steam. Inner and outer rows of tubes slightly curved. A chain scraper is passed through when deposits form on surfaces. The tubes are accessible from outside. A single workman disconnected the four manhole plates and exposed every tube in the boiler within a period of five minutes.

Extreme simplicity and low cost of construction of water tube boilers. Excellence of design in features pertaining to fuel economy, and singular adaptability to situations requiring the use of impure feed water.

(Signed) Geo. R. Barrus,
Individual Judge.

Helios Electric Co
Philadelphia Penn'a

Gentlemen;

In regard to the Helios Lamps we have in use on our Street Circuit will say; We now have 26. 2000 C.P. Helios Lamps running on our streets and giving good satisfaction, The first installation of 17 Lamps was made subject to acceptance by the City Council & before they would accept the lights they had an Expert test & report made, The Lamps was sustained as to Candle Power and Genral efficency & the result was an order for 8 more Lights by the City and 1 by the County on Court House Grounds They give a very clear steady white light, entirely free from the flaking and dying out of the ordinary Circuit Current arc Lamp.

Yours Truly
Barnes Bros

$10.00 Reward!

Some vindicative individual with malice prepense mailed the following "poem" to us anonymously. While we are adverse to paying any attention to anonymous communications, unless accompanied by the cash, we feel impelled to publish this as a simple matter of self-defense. We have lost hours of sleep with the abominable rhyme jingling in our ears, trying to translate the somewhat obscure meaning. To relieve ourselves of further worry, we decided to stop worrying, and offer the following

REWARD!—To the central or isolated station manager, or electrician, sending us the first correct rendition of the verses into plain English, we will give $10.00 worth of Electrical Merchandise to be selected from our catalogue, allowing usual trade discounts. Open until June 1, 1894. Address

Advertising Department,
CENTRAL ELECTRIC CO.

THE ELECTRICIAN'S WOOING.

My darling, wire are you so cold?
Pray let my ohm be thine;
This system me a joy to hold
And pressure hand in mine.

Though you may search from pole to pole,
You'll find that I ampere
Of any one, so let us join,
No motor part my dear.

The gold our station will demand,
Our needs to gratify,
The circumstances I am in-
Candescently supply.

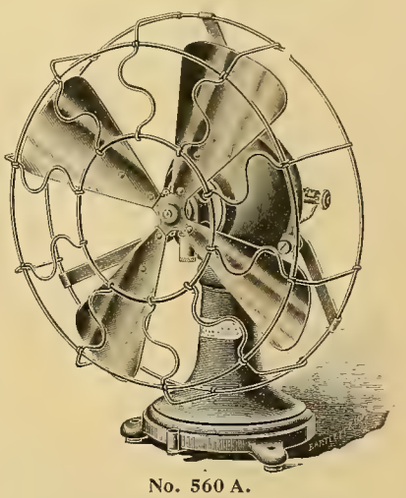
The current of my thought is toward
One central lamp of bliss,*
One heart I volt of there to cling
Need dynamo's it is?

So let us haste to lay our views
Before your pa and ma,
But, if they their consent refuse,
Let's skip the trolley-la.

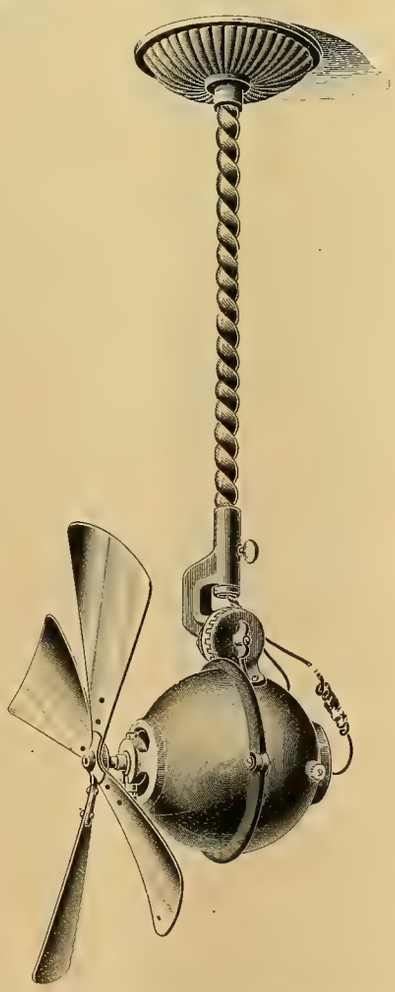
* The author evidently refers to the Pharos Incandescent Lamp.

Lundell Fan Motor Outfits.

No. 560A. 1-12 H. P., with switch giving 1,000, 1,400, 1,800 revolutions per minute. For constant current circuits of 110 to 120 volts. Self-oiling, self-aligning bearings, fixed brushes, NO SPARKING.



No. 560 A.



No. 567 H. SUSPENDED FAN OUTFIT. Lundell Motor.

1-6 H. P. Speed, 1,400 on constant current circuit, 110 to 120 volts. Standard length, from ceiling to end of fan, 4½ ft. on a 12 ft. ceiling.

The Lundell Fan Motors, of which these two are samples, are *unquestionably* the highest achievement in ventilating and comfort giving devices up to date.

They are scientifically designed, beautifully finished, compact (more so than any other make), noiseless; in fact as nearly perfect as we can hope to get.

If you contemplate establishing a drug store, restaurant or office circuit and *making money* hand over fist this summer, NOW is the time to collect your forces, deploy your fighting lines and *get ready*. We will help all we can and you will find that that's a good deal. A *good deal* all around. Fully illustrated catalogue to any address.

What we want is orders.

THE

"CLARK" WIRE.

TRADE MARK.

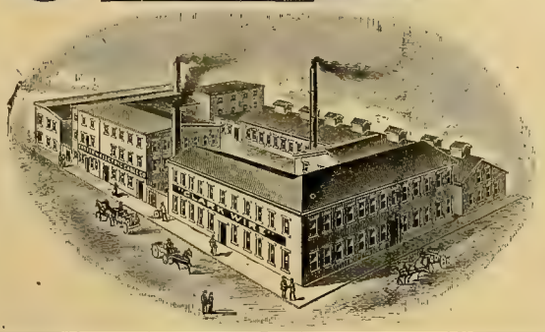
For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,

GREAT WESTERN MFG. CO.,

Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

THE

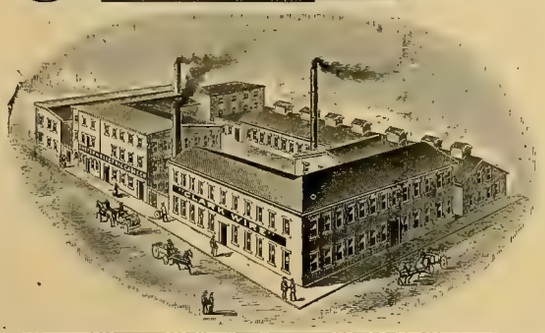
"CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

One 80 H. P. Beck Automatic Engine
One 60 H. P. and One 10 H. P. Westinghouse Automatic Engine.
10, 20, 30, 40 and 50 H. P. Automatic Engines.
100, 200, 300 and 500 H. P. Berryman Feed Water Heaters.
All the above in first-class condition and cheap.

FRANK TOOMEY,
131 N. Third St., Philadelphia, Pa.

THE WONDERFUL

D'Unger Telephone.

Highly Important to Telephone Users.

BEWARE OF INFRINGING!

The D'Unger Long Distance Telephone (the "Far-Away Talker") can now be had for use in Telephone Exchanges on a small annual royalty, and **on no other terms**. It is constructed under numerous patents, especially **Patent No. 390,575,** granted Oct. 2, 1888, which is not only the **first,** but **the only undisputed and indisputable valid patent granted for an All-Carbon Multiple-Contact Microphonic Telephone Transmitter.** All all-carbon multiple-contact telephone transmitters built without or under patents granted since Oct. 2, 1888, are **infringements upon Patent No. 390,575**—a fact to be borne in mind by persons contemplating the use of Telephones.

The "D'Unger" is the only self-cleaning telephone in the world. It sends speech one (1) mile or five thousand (5,000) miles in a perfectly clear manner; can be operated at half the ordinary expense; is always in order, and has for its Receiver a Patent Compound Magneto, making but **one magnetic field**. It has likewise Paul D'Unger's Patent Diaphragm Regulator, which prevents the words from running together. As a whole it is complete, cannot be surpassed, and has no equal. Pronounced by all unprejudiced electricians to be the **Peer of Telephones.** Address

D'Unger Long-Distance Telephone Co.,
Palmer House, CHICAGO, ILL.

No D'Unger Telephones can be had for exchanges except through me. R. D'UNGER.

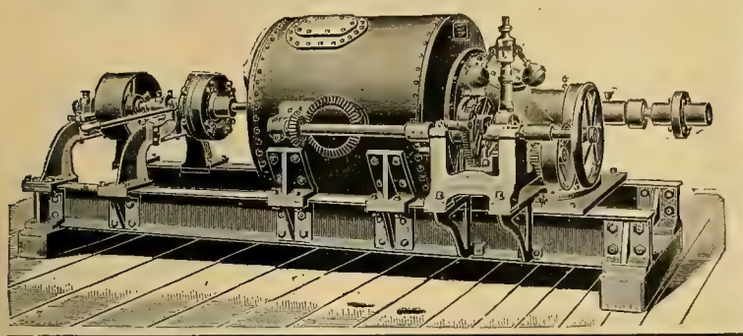
VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high speed and great Efficiency,** and **Large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent. of useful effect **guaranteed.** **SEND FOR CATALOGUE AND PARTICULARS.**

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of of 12-inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

STILWELL & BIERCE MFG. CO., - Dayton, Ohio.

TO OUR TELEPHONE FRIENDS.

CONSULTATION.—We are large dealers in Coppers but we'll waive that point this time as we wish now to consult with you on other matters, viz.:

As the resistance of the primary circuit in a telephone transmitter, i. e., coil, carbon button and contact, is very low, necessary from the fact that the changes in the current caused by talking against the diaphragm must be rapid and the flow of the current should not be impeded but assisted, we wish to ask you if this is not best accomplished by using a battery of known low internal resistance and of unchangeable resistance that the adjustment of the transmitter, when the battery is first connected up, need be the only adjustment until the battery needs renewal of the solution. Your opinion of course is in the affirmative, therefore, consult with those that use the celebrated Law Double Cylinder Cell, and they will undoubtedly advise you to use that cell and no other. It has a negative element surface of 147 sq. in. and a jar admitting of 2½ pints of solution, therefore, its holding up power must be great. It gives an ample uniform current from first to last, and does not deteriorate and thereby increase its internal resistance. Its first cost is about its only cost. Do not overlook the fact that we are large dealers in Sal Ammoniac, Zincs, Clay and Carbon Porous cup cells, Acid cells, Plunge Batteries, etc.

LAW BATTERY COMPANY, 85 JOHN ST., NEW YORK.

The "New Era" ELECTRIC GAS LIGHTERS.

Newly Improved.

Are the only Electric Lighters made that are successfully operated by the key.

Which always indicates whether the gas is on or off. Safe, reliable; will not fail to light; have interchangeable stems; are adaptable to any fixtures, and fully guaranteed. Made in 5 styles but all on the same general principle as style shown. Candle, Billiard, Argand. Our **Victor** with side lever, is a little wonder.

BUILDERS OF RAILWAY AND TRAMWAY CARS OF ALL CLASSES.

Special attention given to the building of Electric Motor and Trail Cars.
Builders of Brill No. 21 Truck with solid forged frame, and "Eureka" Maximum Traction Pivotal Truck

---

"IDEAL" INSULATED COPPER WIRE.
Best Substitute for Rubber.
HIGH INSULATION. LONG LIFE. LOW COST.
— MANUFACTURED BY —
PHILLIPS INSULATED WIRE CO.
NEW YORK OFFICE: 39-41 Cortlandt Street. FACTORY: PAWTUCKET, R. I.
AGENCIES:
Electric Appliance Co., CHICAGO. Partrick & Carter Co., PHILADELPHIA. Electrical Engineering Co., MINNEAPOLIS.

WESTINGHOUSE ELECTRIC & MANUFACTURING CO.,

PITTSBURGH, PA.

We manufacture Complete Installations of

ELECTRICAL APPARATUS

For **CENTRAL STATION ELECTRIC LIGHTING,**
LONG DISTANCE TRANSMISSION OF POWER,
ELECTRIC RAILWAY AND ISOLATED PLANTS.

BRANCH OFFICES IN ALL LARGE CITIES.

ELECTRICITY FOR ENGINEERS.

Part I, 268 Pages, $2.00. Part II, 156 Pages, $1.00.

WHEN ORDERED TOGETHER PRICE IS $2.50.

Both Works Profusely Illustrated.

☛ **Just the Work for Engineers, Electricians, Dynamo Tenders, etc.**

PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current—How Produced—Induction—Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting— Testing— Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel— Multiple Series — Multiple Series Cut-Out—Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators—Brushes—Different Styles of Brushes—Double Brushes—Single Brushes—Troubles with Commutators and Brushes—Correct Position of Brushes—Sparking at Brushes—Care of Brushes and Commutators—Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation—Dynamo—Extra Brush—Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from Those Used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation—Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

Orders Promptly Filled on Receipt of Price. Postage Prepaid.

STREET LIGHTING FROM ALTERNATING CURRENT DYNAMOS.

New Prices given on Lamps, Street Fixtures, Bank Boards, Series Sockets, Poles, Meters

And all accessories for the use of SERIES LAMPS on ALTERNATING CURRENT DYNAMOS.

This system permits a PROFITABLE and SATISFACTORY method of street illumination and should be investigated by every plant using alternating current apparatus. WRITE FOR FURTHER PARTICULARS AND PRICES.

OUR SERIES LAMPS

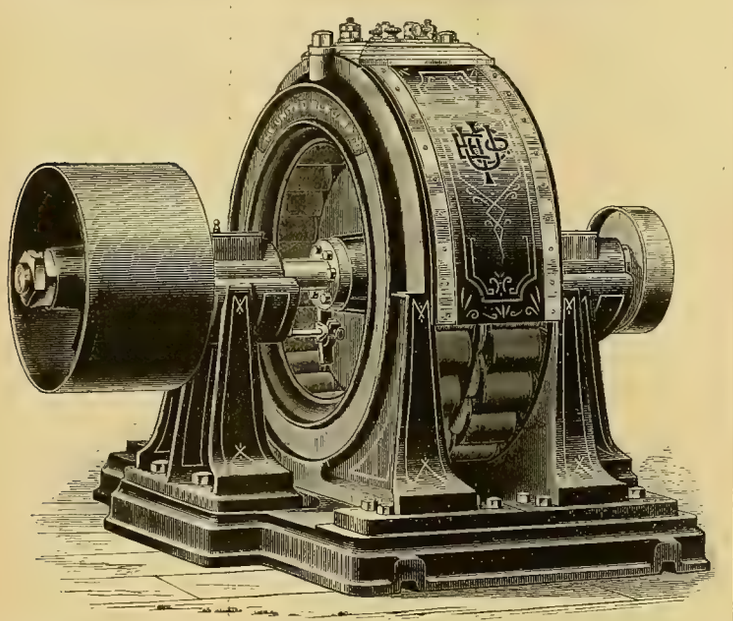
Will show you a COMPARATIVE SAVING equal to their FIRST COST in POWER CONSUMED.

BERNSTEIN ELECTRIC COMPANY, 620 Atlantic Ave., Boston, Mass.

The United Electric Improvement Co.,

838 Drexel Bldg., Philadelphia,

Desires to correspond with responsible parties actively engaged in the sale of electric lighting apparatus in the following cities, viz.:



New York, New Orleans, St. Paul, Montreal, *San Francisco, Cincinnati, Galveston, Salt Lake City, Jacksonville.* *Omaha, Boston. Atlanta, Denver,* *Seattle, Los Angeles, Baltimore, San Antonio*

To those desirous of taking up the sale of Alternating Current Apparatus of undoubted merit, an opportunity is offered.

THE HELIOS LAMP FOR STREET LIGHTING.

OFFICE OF BARNES BROTHERS, Manufacturers of Steam Engines and Boilers, Wind Mills, Horse Powers, Stalk Cutters, Iron Pumps, House Castings. Dealers in all kinds of Farm Machinery, Steam Fittings and Brass Goods. Creamery Outfits a Specialty.

Muquoketa, Iowa, _____ 189_

Helios Electric Co.

Philadelphia Penn'a

Gentlemen:

In regard to the Helios Lamps we have in use on our Direct-Circuit will say, We now have 26. 2000 C.P. Helios Lamps running on our streets and giving good satisfaction. The first installation of 17 Lamps was made subject to acceptance by the City Council, and before they would accept the lights they had an Expert test and report made. The Lamps was sustained as to Candle Power and General efficency, & the result was an order for 8 more Lights by the City and 1 by the County on Court House Grounds. They give a very clear steady white light, entirely free from the flaking and leaping out of the ordinary Direct Current arc Lamp.

Yours Truly

Barnes Bros

OKONITE TRADE MARK.

The CENTRAL ELECTRIC Co.

MANUFACTURERS, IMPORTERS AND JOBBERS IN **Electrical Supplies** CHICAGO.

OKONITE TRADE MARK

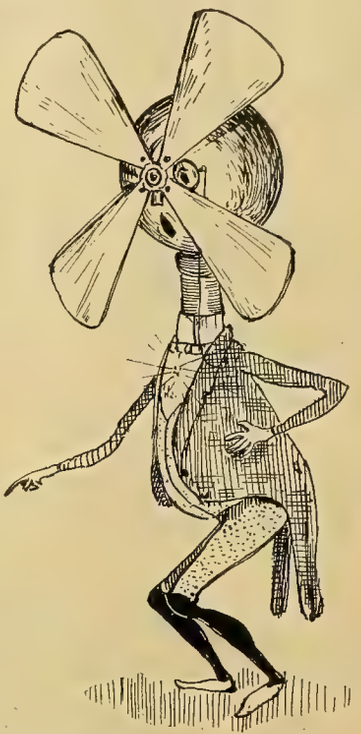
THE BEST APPOINTED AND LARGEST ELECTRICAL SUPPLY HOUSE IN THE WORLD.

"Jess' sure's I start out t'have a roarin hot time of it—thatsh fellow Lundell comes 'round—he—he—hash such a **depressing** 'fect on **me!**"

He's wurs in' ice-man!

The Thermometer

Starts out with a pretty good showing for May—getting his spirits up near the nineties—hottest May-day in 20 years—there's no telling how he'll bob up in June, July, August, and September. The safest thing to do is to fix for the unexpected.



Get your assortment now—

Ceiling fans, desk fans, bracket fans. Have them shipped by freight—**save express charges**—because one of these hot days about every other restaurant or drug store in town will ring up—

> "Hello, 'ello, that you Hustler? well how soon can you put in one of those fan-moters? this is simply awful! whew! well, rush it in quick before we melt! And, say—hello!—say, will it keep the flies off?"

And don't forget, that if you know of some invalid, burning up with a fever, and you haven't got a circuit down that way, a Lundell fan-motor with an Edison-Leland battery, will do more than half the medicine—make a cool fresh breeze; comforting, grateful, life-saving. We can supply anything you want, and send them quick, but order **now**—freight is cheapest.

WASHINGTON CARBONS.

How about that poem in last week's issue?

If you are contemplating the purchase of **Alternating Apparatus**, get

TWO-PHASE GENERATORS

which will cost no more than single phase. You can then operate lights as economically and as satisfactorily as from single phase generators, and in addition use

ALTERNATING CURRENT MOTORS,

which we are now building in 1, 2, 3, 5, 7, 10 and 15 Horse Power sizes. Our standard

TRANSFORMERS

For lighting purposes are carried in stock, and orders can be filled promptly.

The most economical and easiest handled transformer on the market. Special transformers for any desired voltage. Special transformers for arc lighting.

STANLEY ELECTRIC MFG. CO.,

PITTSFIELD, MASS.

Selling Agents for the Helios Arc Lamps in New England and New York State.

Western Office, 102 Michigan Avenue, CHICAGO, ILL.

Don't make a Alternating Arc investigating

By Buying any Lamp before the

MON-ARC

Everything about it is of the very best. Brass Frame, Brass Shell, Brass Cap, Brass Rods. No tin or stovepipe iron. It combines unequaled simplicity with absence of all objectionable features heretofore present in alternating lamps. It is a **NON-STICKER** that central station men and lamp trimmers will be **STUCK** on because they don't have to **MONKEY** with it every few days, taking it down to clean and oil. Lamps for all systems. We guarantee every lamp. Write for prices.

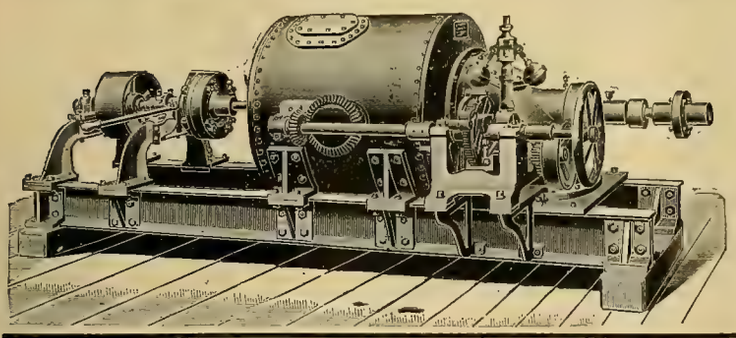
Toronto, Ont.: Toronto Electrical Works.

VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high speed and great Efficiency,** and **Large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent. of useful effect **guaranteed.** **SEND FOR CATALOGUE AND PARTICULARS.**

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of of 12-inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

STILWELL & BIERCE MFG. CO., - Dayton, Ohio.

"To be or not to be, that is the question:

Whether 'twere nobler in the mind to suffer
The stings and arrows of outraged fortune,
Or take arms against a sea of trouble
And by opposing, end them."

Our reply is, "To arms, to arms!" Rally around the standard; show a bold front to trouble; energetically press against it, and end it.

The standard we hold aloft is the Law Double Cylinder Cell. It is the embodiment of endurance, power, uniformity, cleanliness, and everything else that should go to make up **THE** only open circuit cell of the world.

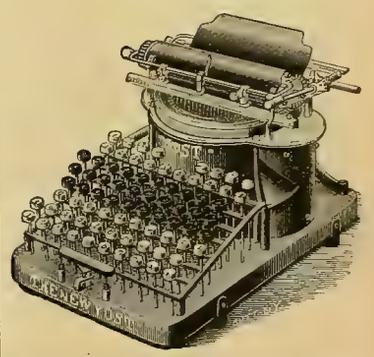
Telephonists say so; Bell-Hangers say so; Physicians say so; and everybody else says so, except you, unknown friends: therefore, if the Cells you handle are giving you a "sea of trouble" we advise you, instead of being "penny wise" and a five-dollar-bill-foolish, to "oppose your trouble" by adopting the Law Double Cylinder Cell.

We manufacture various other Cells designed to meet various requirements. Let your wants be known and we shall take pleasure in giving to you the benefit of our experience as to which type you require.

LAW BATTERY COMPANY, 85 John St., New York.

Zincs, Sal Ammoniac and Everything Else in the Battery Material Line.

The New Yost 1894 Model.



Constructed on principles radically its own, insuring results always sought for but absolutely unattainable in the construction of any other machine. It is pre-eminently the telegrapher's and professional stenographer's typewriter.

Let us send you catalogue.

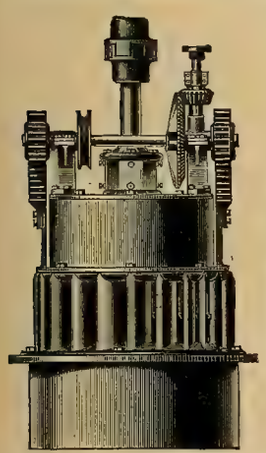
ELECTRICIAN PUBLISHING CO.,
6 Lakeside Building, CHICAGO, ILL.

NORTH STAR POINTS

Is the title of a book of reference for all points between Chicago and Lake Superior on the line of the Milwaukee & Northern R. R., and is a valuable publication for business men and tourists who may be interested in the development of the agricultural, mineral and timber resources of Northern Wisconsin and the Upper Peninsula of Michigan. This book, together with an illustrated pamphlet telling "*Where the Trout Hide*" will be sent free upon application to Geo. H. Heafford, General Passenger Agent, "North Star Route," Chicago, Ill.



THE McCORMICK TURBINE,

On Vertical or Horizontal Shaft,
Especially Adapted for Electric Work.

Gives more power as to diameter with a higher percentage of useful effect than any other water-wheel heretofore made. All sizes, right and left hand, are built from patterns perfected under systematic tests in the Holyoke Testing Flume.

Parties having power plants which are unsatisfactory, and those contemplating the improvement of powers, will find it to their interest to confer with me, **as I am willing to guarantee results where others have failed, no matter what make of turbine has been in use. STATE REQUIREMENTS AND SEND FOR CATALOGUE.**

S. MORGAN SMITH, York, Pa.

Estimates furnished for complete power plants and results guaranteed.

JUST OFF THE PRESS.

INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

CONTENTS.

PART I.—Polyphase Currents.

CHAPTER 1....Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors.—Synchronizing Motors.—Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31....."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

PART III.—Miscellaneous Inventions and Writings.

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by

ELECTRICITY FOR ENGINEERS.

Part I, 268 Pages, $2.00. Part II, 156 Pages, $1.00.

WHEN ORDERED TOGETHER PRICE IS $2.50.

Both Works Profusely Illustrated.

☛ **Just the Work for Engineers, Electricians, Dynamo Tenders, etc.**

PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current—How Produced — Induction — Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting—Testing—Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel—Multiple Series — Multiple Series Cut-Out — Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators—Brushes—Different Styles of Brushes—Double Brushes—Single Brushes—Troubles with Commutators and Brushes—Correct Position of Brushes—Sparking at Brushes—Care of Brushes and Commutators—Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation — Dynamo — Extra Brush — Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from Those Used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation — Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

Orders Promptly Filled on Receipt of Price. POSTAGE PREPAID.

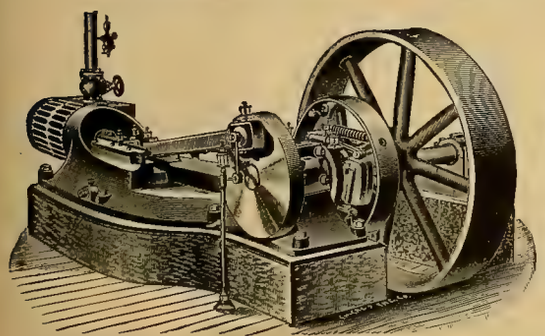
ANNOUNCEMENT.



The entire stock of drawings, patterns, finished and unfinished engines of the **GIDDINGS AUTOMATIC** type have been purchased of the Sioux City Engine Works by **THE BROWNELL & COMPANY** of Dayton, Ohio, who have secured the exclusive right to manufacture under these patents and have engaged the services of **Mr. C. M. GIDDINGS, M. E.,** who is the original designer and patentee of this engine, as Superintendent of their Engineering Department, and who will turn out strictly **HIGH GRADE** work for **ELECTRIC LIGHT AND RAILWAY PURPOSES.** Having one of the largest boiler manufactories in the country, they are prepared to equip and install complete power plants ready for operation at prices which will defy competition.

WATCH THIS SPACE FOR CHANGE EACH ISSUE.

YOU NEED THESE BOOKS.

NEW
DYNAMO TENDERS' HAND-BOOK.

By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. *138 Engravings.*

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.

By Lieut. F. B. Badt.

Fourth Edition. **Tenth Thousand.**

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. **42 Illustrations.**

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.

By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.

By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS.
"TRAMS."

Their Construction, Operation and Maintenance.

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. *Profusely Illustrated.*

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.

By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY
... OF ...
ELECTRICAL WORDS,
TERMS AND PHRASES.

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. **750 Illustrations.**

PRICE, $5.00.

THE ELECTRIC MOTOR
AND ITS APPLICATIONS.

By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT
OF
DYNAMOS AND MOTORS.

By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS
FOR THE USE OF
Engineers and Architects.

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY
IN
THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. *Profusely Illustrated.*

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.

Experiments with Alternate Currents.

By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage,** and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly**-operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

THE JAMES LEFFEL & CO. SPRINGFIELD, OHIO, AND NEW YORK CITY.

CHICAGO, May 14, 1894.

MR. W. H. McKINLOCK,
Prest. METROPOLITAN ELECTRIC CO.,
188 Fifth Avenue, Chicago.

DEAR SIR:---Your new catalogue has just been received, and I find it the most complete catalogue I have yet seen, and it gives evidence of more than usual care in compiling. I have no doubt but that you will find it of great benefit to you, and I hope that such will be the case.

Yours very truly,
F. S. TERRY.

We consider the above testimony of incalculable value, and those who have not received a copy of our catalogue should get one at once. We want you to have one.

METROPOLITAN ELECTRIC CO.,

186 and 188 Fifth Ave., Chicago.

WM. H. McKINLOCK, President. **W. C. McKINLOCK, Secretary.**

No. 61,535.

No. 61,235.

No. 61,565.

No. 61,465.

These Cut-Outs, for use on both two and three-wire systems, are constructed of the best hard, white, vitrified, non-absorbent Porcelain, which is made at our special porcelain factory at our Schenectady Works. This porcelain is of the highest insulation obtainable, and is the accepted standard throughout this country.

These Cut-Outs have been carefully designed to meet the strictest requirements of the fire underwriters, and with a view to obtain the maximum of reliability with the minimum of space and trouble. The LINK CUT-OUT is provided with a cover of mica. In the PLUG CUT-OUT the fuse is contained in a small brass cased plug screwed into the cut-out. Should the fuse blow, a new plug can be immediately inserted without the use of any tools.

The wire clamping device in these Cut-Outs is new and the best yet invented.

THE HELIOS LAMP

For Street Lighting.

Conneaut, O., Feby. 6th, 1894.

Helios Electric Co.,

Philadelphia, Pa.

Gentlemen:-

We are in receipt of your inquiry regarding your Alternating Arc Lamps; would say, they are just simply perfection. We now have 14 in use and work to our entire satisfaction in every respect; the light is absolutely steady and the only arc Lamp that I ever saw that gives a perfect steady light. It has been said that there could not be an arc lamp made to work on the Alternating current and do good work, but you have struck it, and I have got to hear the first word spoken against it, and in my opinion the Direct Current Lamp has seen its day.

Yours respectfully,

W. H. Webb Supt.,

Conneaut Electric Light Co.

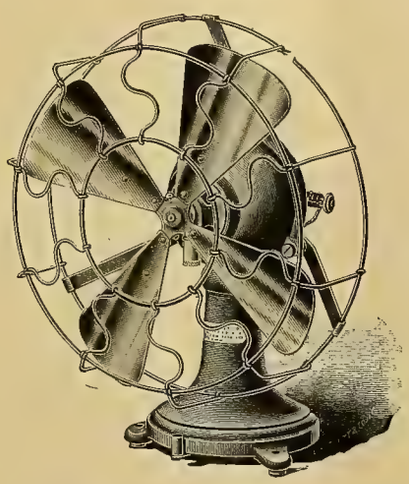
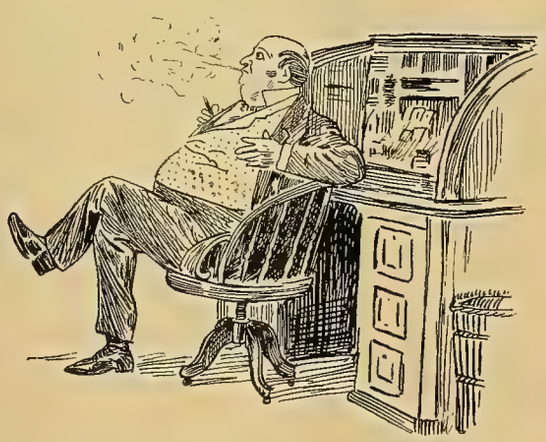
A Critical Inspection

Of the Lundell Fan Motor will result in just one way—Orders.

It won't be necessary to smoke more than a couple of good cigars over it—but its worth a **box** to discover just what you **want** in the way of motors. Please remember that it isn't for a day only—or a month—or a single season, but for next year and the year after.



When you buy a Fan Motor, or sell one, it ought to **stay** bought or sold. The Lundell Motors do just that thing.



Put them up right in the first place and you are done—there's no tinkering, no arguing your customer into keeping it. Why! he wouldn't let you have it back **at a premium** if he couldn't get another just like it.

We have in stock every kind of a Fan Motor that your trade will call for. We can ship promptly by freight, or express; better order ahead and save the express charges. If you haven't one of our catalogues we will be pleased to send one.

There is some fun ahead on the "Electrician's Wooing."

Don't make a Alternating Arc investigating

By Buying any Lamp before the

MON-ARC

Everything about it is of the very best. Brass Frame, Brass Shell, Brass Cap, Brass Rods. No tin or stovepipe iron. It combines unequaled simplicity with absence of all objectionable features heretofore present in alternating lamps. It is a **NON-STICKER** that central station men and lamp trimmers will be **STUCK** on because they don't have to **MONKEY** with it every few days, taking it down to clean and oil. Lamps for all systems. We guarantee every lamp. Write for prices.

PARANITE WAS USED

Exclusively in the wiring of the new West Side Tunnel in Chicago.

WHY?

Because the highest grade of rubber insulation that the market affords was required for that work, and the result was that

PARANITE WAS CHOSEN.

Wherever the conditions are unusually severe and exceptional difficulties have to be met in a job of electric light wiring, requiring superior insulating and staying qualities, PARANITE will be found to come out the winner.

WHY USE ANY OTHER

Wire when we are offering PARANITE at competitive prices?

—— MANUFACTURERS OF ——

DIRECT CURRENT MULTIPOLAR DYNAMOS AND GENERATORS.

These machines are constructed with outside revolving armatures, without and with special commutator, as desired. They have proved remarkably efficient and economical. Used largely in European Central Stations. They are slow-speed machines, made for direct connection to engine without belting, and in sizes from 20 H. P. to 1,500 H. P.

HIGH-SPEED BELTED SIEMENS DYNAMOS

Are copied extensively in this country as "Drum Type." We are building these machines in sizes from 1 H. P. to 150 H. P.

ALTERNATING AND MULTIPHASE CURRENT DYNAMOS

With laminated field and armature, in sizes from 1 H. P. to 4,000 H. P., for belted or direct coupling.

MOTORS

Of every speed for direct, alternating or multiphase current, in sizes from 1-10 H. P. up to 4,000 H.P. Durable and economical in operation.

SIEMENS BAND LAMPS

For direct and alternating current, for constant potential and series machines.

SIEMENS ARC LIGHT CARBONS

With either solid or soft cores, which are the most economical in the world and give a steady light.

ALL INSTRUMENTS

Requisite for the regulation of electric apparatus; also the Siemens Voltmeters and Ammeters and Automatic devices made in Berlin.

W. U. Double Petticoat Teat Insulator.

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. This device can be applied to any insulator.

Standard Screw Glass Insulators, Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems, Colored Glass Insulators to designate different currents.

THE

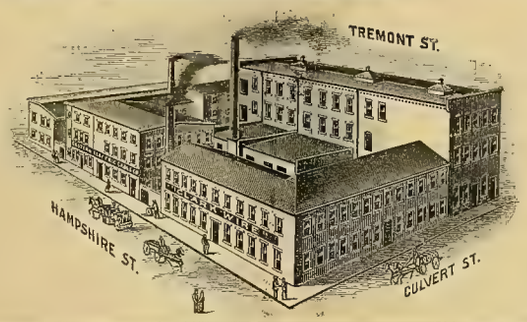
"CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

10, 20, 30 40 and 50 H. P. Automatic Engines.
100, 200, 300 and 500 H. P. Berryman Feed Water Heaters.
All the above in first-class condition and cheap.

FRANK TOOMEY,
131 N. Third St., Philadelphia, Pa.

FOR SALE.

In alternators we have 300 T.-H., 500 and 750 Westinghouse 1, 2 and 3,000 Slattery.
In arc 20, 30 and 45 Brush, 25 and 50 T.-H. and a lot of T.-H. arc lamps, K2 and D.

Rose Electric Light Supply Co.,

ST. LOUIS, MO.

Good Business Opportunity.

For man with from $10,000 to $20,000 to manufacture electrical apparatus in prosperous city in southern Michigan.
New factory will be given to such a man or company upon certain easy conditions.
Address "**Electrical Engineer,**"
Care WESTERN ELECTRICIAN,
6 Lakeside Building, Chicago.

WANTED.

A mechanical and electrical engineer, graduate of the University of Michigan, with several years' practical experience in all kinds of electrical and mechanical repair work, management and installation of electric plants and power stations, capable of doing all kinds of electrical engineering work, desires a position as electrical engineer, manager of an electric plant in some progressive town, where he can locate. Correspondence invited. Address **E. E., U. of M.**, Care WESTERN ELECTRICIAN, 6 Lakeside Building, Chicago.

Wanted, an Electric Light Plant.

An experienced central station manager wants to lease, with an option of purchase, an Electric Light Plant in a city of from 5,000 to 10,000 inhabitants. Will put plant in first-class order and furnish new apparatus necessary to put plant on an economical running basis. Location must be in the south or west. Address "*MANAGER*,"
Care WESTERN ELECTRICIAN,
6 Lakeside Bldg., Chicago.

ELECTRICIANS!!

We can supply you at very low rates with authentic BLUE PRINTS, showing connections, dimensions, data, etc., of the leading types of electrical machinery and apparatus. Don't employ expensive experts when you can get these prints. Send ten cents for sample prints with list and prices.

STEARNS, BUCK & CO.,
Electrical Engineers. 40 Kilby St., Boston, Mass.

For Rent—In THE BELDEN, 295, 297, 299 Belden Avenue, Corner Fremont Street, short distance west of Lincoln Park, Chicago.

A seven room CORNER flat with all modern appointments, including steam heat, janitor, gas range, gas grates and logs, hot water, refrigerator, side-board, three wood mantels, handsome oak and marble entrance, private storeroom and laundry; every room as light as day; the only vacant flat in the building; rent reduced to $50.00. J. B. Carney, on premises, or at 6 Lakeside Building.

THE WONDERFUL

D'Unger Telephone.

Highly Important to Telephone Users.

BEWARE OF INFRINGING!

The D'Unger Long Distance Telephone (the "Far-Away Talker") can now be had for use in Telephone Exchanges on a small annual royalty, and **on no other terms**. It is constructed under numerous patents, especially **Patent No. 390,575**, granted Oct. 2, 1888, which is not only the **first**, but **the only undisputed and indisputable valid patent granted for an All-Carbon Multiple-Contact Microphonic Telephone Transmitter.** All all-carbon multiple-contact telephone transmitters built without or under patents granted since Oct. 2, 1888, are **infringements upon Patent No. 390,575**—a fact to be borne in mind by persons contemplating the use of Telephones.

The "D'Unger" is the only self-cleaning telephone in the world. It sends speech one (1) mile or five thousand (5,000) miles in a perfectly clear manner; can be operated at half the ordinary expense; is always in order, and has for its Receiver a Patent Compound Magneto, making but **one magnetic field**. It has likewise Paul D'Unger's Patent Diaphragm Regulator, which prevents the words from running together. As a whole it is complete, cannot be surpassed, and has no equal. Pronounced by all unprejudiced electricians to be the **Peer of Telephones.** Address

D'Unger Long-Distance Telephone Co.,
Palmer House, CHICAGO, ILL.

No D'Unger Telephones can be had for exchanges, except through me. R. D'UNGER.

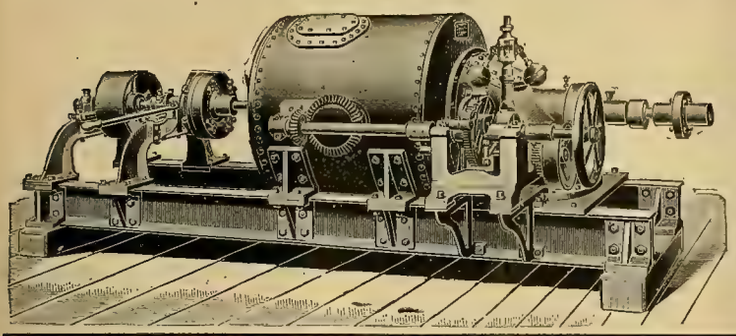
VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high speed and great Efficiency,** and **Large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent. of useful effect **guaranteed.** **SEND FOR CATALOGUE AND PARTICULARS.**

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of of 12-inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

STILWELL & BIERCE MFG. CO., - Dayton, Ohio.

HAMLET

ACT V. SCENE I.

Hamlet. Why, I will fight with him upon this theme Until my eyelids will no longer way.

The theme referred to by "Ham" was the Law Double Cylinder cell, and the party he was seeking to get on a match with was, of course, imaginary. The meaning he intended to convey to the Queen was that if perchance anyone should venture to say anything against the good qualities of this Cell, that he would Then set his eyelids wagging.

Well, he was right in taking this position, for it cannot be denied that the Law Double Cylinder cell is the standard open circuit cell of the World, for it embodies all the qualities that should go to make up such a cell, namely:

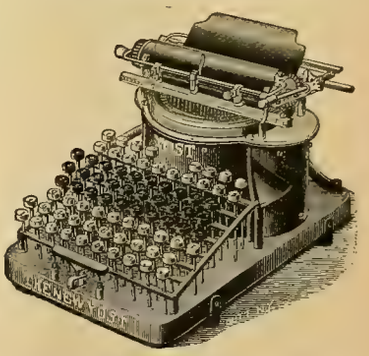
High E. M. F.,
Uniformity of Current,
Cleanliness,
Low Internal Resistance,
Great Holding-up Power,
Cheapness.

Friend, there is a divinity that shapes your ends rough, hew them how you will. In other words, you may hew your way along in business for a little while with cells that at the outset are cheap, but there is a divinity that will surely urge you our way; take our word for it, you will be glad ere long to give us your patronage.

LAW BATTERY COMPANY, 85 John St., New York.

Various other Cells. Zincs, Salammoniac; in short, Battery Materials in general.

The New Yost 1894 Model.



Constructed on principles radically its own, insuring results always sought for but absolutely unattainable in the construction of any other machine. It is pre-eminently the telegrapher's and professional stenographer's typewriter.

Let us send you catalogue.

WHEN ORDERED TOGETHER PRICE IS $2.50.

Both Works Profusely Illustrated.

☛ **Just the Work for Engineers, Electricians, Dynamo Tenders, etc.**

PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current—How Produced—Induction—Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting— Testing— Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel— Multiple Series — Multiple Series Cut-Out—Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators—Brushes—Different Styles of Brushes—Double Brushes—Single Brushes—Troubles with Commutators and Brushes—Correct Position of Brushes—Sparking at Brushes—Care of Brushes and Commutators—Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation—Dynamo—Extra Brush—Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from Those Used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation—Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

Orders Promptly Filled on Receipt of Price. Postage Prepaid.

NEW DYNAMO TENDERS' HAND-BOOK.

By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. 138 Engravings.

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.

By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.

By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.

By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS. "TRAMS."

Their Construction, Operation and Maintenance.

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

600 Pages. Profusely Illustrated.

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.

By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY ... OF ... ELECTRICAL WORDS, TERMS AND PHRASES.

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. 750 Illustrations.

PRICE, $5.00.

THE ELECTRIC MOTOR AND ITS APPLICATIONS.

By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT OF DYNAMOS AND MOTORS.

By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS FOR THE USE OF Engineers and Architects.

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. Profusely Illustrated.

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.

Experiments with Alternate Currents.

By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

The "CLIMAX" STEAM BOILER

Three Boilers Sold Chicago Edison Co.

The Only Boiler Tested at the World's Columbian Exposition.

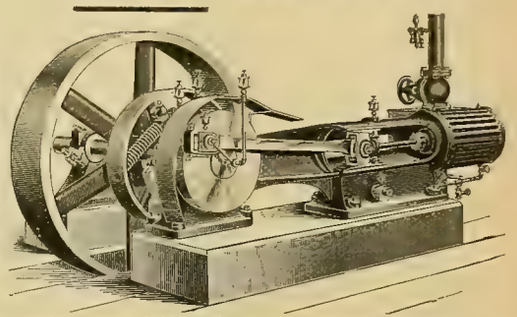
The only NON-EXPLOSIVE boiler made.
Will save you money on coal.
Built in units from 50 to 1500 H. P.

MANUFACTURED BY

Clonbrock Steam Boiler Works,

Grinnell and Court Sts., BROOKLYN, N. Y.

ANNOUNCEMENT.



The entire stock of drawings, patterns, finished and unfinished engines of the **GIDDINGS AUTOMATIC** type have been purchased of the Sioux City Engine Works by **THE BROWNELL & COMPANY** of Dayton, Ohio, who have secured the exclusive right to manufacture under these patents and have engaged the services of **Mr. C. M. GIDDINGS, M. E.,** who is the original designer and patentee of this engine, as Superintendent of their Engineering Department, and who will turn out strictly **HIGH GRADE** work for **ELECTRIC LIGHT AND RAILWAY PURPOSES.** Having one of the largest boiler manufactories in the country, they are prepared to equip and install complete power plants ready for operation at prices which will defy competition.

These Cut-Outs, for use on both two and three-wire systems, are constructed of the best hard, white, vitrified, non-absorbent Porcelain, which is made at our special porcelain factory at our Schenectady Works. This porcelain is of the highest insulation obtainable, and is the accepted standard throughout this country.

These Cut-Outs have been carefully designed to meet the strictest requirements of the fire underwriters, and with a view to obtain the maximum of reliability with the minimum of space and trouble. The LINK CUT-OUT is provided with a cover of mica. In the PLUG CUT-OUT the fuse is contained in a small brass cased plug screwed into the cut-out. Should the fuse blow, a new plug can be immediately inserted without the use of any tools.

The wire clamping device in these Cut-Outs is new and the best yet invented.

THE HELIOS LAMP

For Street Lighting.

OFFICE OF

Conneaut Electric Lighting Co.

T. S. WINSHIP, PRESIDENT.
C. HAYWARD, SECRETARY.
A. O. HOBKINS, TREASURER.
W. H. WEBB, SUPERINTENDENT.

Conneaut, O., Feby. 6th, 1894.

Helios Electric Co.,

Philadelphia, Pa.

Gentlemen:-

We are in receipt of your inquiry regarding your Alternating Arc Lamps; would say, they are just simply perfection. We now have 14 in use and work to our entire satisfaction in every respect; the light is absolutely steady and the only arc Lamp that I ever saw that gives a perfect steady light. It has been said that there could not be an arc lamp made to work on the Alternating current and do good work, but you have struck it, and I have got to hear the first word spoken against it, and in my opinion the Direct Current Lamp has seen its day.

Yours respectfully,

W. H. Webb Supt.,

Conneaut Electric Light Co.

HELIOS ELECTRIC CO., 1310 Filbert St., Philadelphia.

STREET LIGHTING FROM ALTERNATING CURRENT DYNAMOS.

New Prices given on Lamps, Street Fixtures, Bank Boards, Series Sockets, Poles, Meters

And all accessories for the use of SERIES LAMPS on ALTERNATING CURRENT DYNAMOS.

This system permits a PROFITABLE and SATISFACTORY method of street illumination and should be investigated by every plant using alternating current apparatus. WRITE FOR FURTHER PARTICULARS AND PRICES.

OUR SERIES LAMPS

Will show you a COMPARATIVE SAVING equal to their FIRST COST in POWER CONSUMED.

BERNSTEIN ELECTRIC COMPANY, 620 Atlantic Ave., Boston, Mass.

"Oh, Francis, just looking for you—you are a bit fatigued, aren't you?—and it's *so* warm—"

"Yes—I'm quite exhausted."

"Well, just run into the library, dear, you will find it delightfully cool in there—"

"Why, Ethel! they haven't quarreled *again*—"

"Oh! no—it's a 'fan-motor'—papa has one of those Lundell Fans. We ordered several for this evening, but unfortunately, the 'station' said they were out. *So* disappointed, they're *such* a comfort—papa has ordered some direct from the Central Electric Co., Chicago—but run along now, dear, I've kept you too long—"

"Thanks! such a crush, isn't there?"

"Quite—shall I send you an ice?"

"No—yes—send Dick—"

"Oh! you'll have a chill—with the motor, an ice and a nice man—"

"Bye."

No job of interior wiring is complete, safe, sound, secure, get-at-able, unless encased with ***Interior Conduits.*** We carry a large stock, including plain and armored tubing, elbows, distribution and junction boxes, sockets, bases, etc. Let us send you our illustrated catalogue. It's a good thing to have on your desk for handy reference.

The Central Electric Company,

173-175 Adams Street, Chicago.

Don't make a Alternating Arc investigating

By Buying any Lamp before the

MON-ARC

Everything about it is of the very best. Brass Frame, Brass Shell, Brass Cap, Brass Rods. No tin or stovepipe iron. It combines unequaled simplicity with absence of all objectionable features heretofore present in alternating lamps. It is a **NON-STICKER** that central station men and lamp trimmers will be **STUCK** on because they don't have to **MONKEY** with it every few days, taking it down to clean and oil. Lamps for all systems. We guarantee every lamp. Write for prices.

ELECTRIC RAILWAY APPLIANCES.

We claim for our overhead material for electric railways superiority to any on the market in the following respects:

FIRST:—Its adaptability to the purposes designed, combined with tensile strength and lightness.

SECOND:—Its high insulation. We use hard rubber of unusual thickness, which has not only a higher insulation resistance than is possible with cheap compounds of Asbestos, Mica, etc., but also greater strength and durability. Our forms give perfect protection against moisture at all points; many others are not protected against moisture thrown into the suspension by the trolley wheel.

THIRD:—In that our appliances satisfactorily meet all the varying conditions experience has shown are met with in electric railway construction and maintenance.

We invite inspection and competitive tests of our goods, and solicit the privilege of bidding upon specifications for all electric railway material.

W. U. Double Petticoat Teat Insulator.

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. This device can be applied to any insulator.

Standard Screw Glass Insulators, Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems. Colored Glass Insulators to designate different currents.

THE

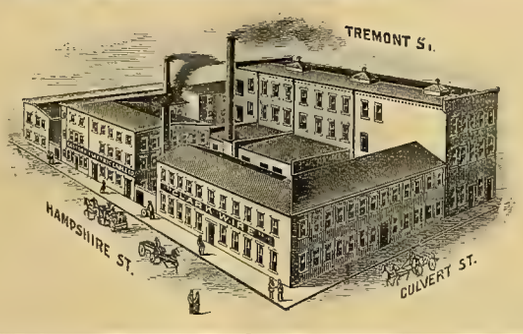
"CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

A seven room CORNER flat with all modern appointments, including steam heat, janitor, gas range, gas grates and logs, hot water, refrigerator, side-board, three wood mantels, handsome oak and marble entrance, private storeroom and laundry; every room as light as day; the only vacant flat in the building; rent reduced to $50.00. J. B. Carney, on premises, or at 6 Lakeside Building.

Sleepers Between Chicago and Milwaukee.

The Chicago, Milwaukee & St. Paul Railway is now running sleeping cars with drawing rooms on night trains between Chicago and Milwaukee. Sleepers can be taken in Union Passenger Station any time between 9:30 and midnight, train leaving Chicago at 3:00 a. m., arriving at Milwaukee at 5:15 a. m., passengers remaining in sleeper until 7:30 a. m. Similar arrangements Milwaukee to Chicago. Berth rate $1.50. For further particulars, for tickets and berths, apply at City Ticket Office, 207 Clark St. (Telephone Main 2190), or at Ticket Office, Union Passenger Station.

THE WONDERFUL

D'Unger Telephone.

Highly Important to Telephone Users.

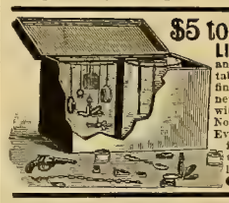
BEWARE OF INFRINGING!

The D'Unger Long Distance Telephone (the "Far-Away Talker") can now be had for use in Telephone Exchanges on a small annual royalty, and **on no other terms.** It is constructed under numerous patents, especially **Patent No. 390,575,** granted Oct. 2, 1888, which is not only the **first,** but **the only undisputed and indisputable valid patent granted for an All-Carbon Multiple-Contact Microphonic Telephone Transmitter.** All all-carbon multiple-contact telephone transmitters built without or under patents granted since Oct. 2, 1888, are **infringements upon Patent No. 390,575**—a fact to be borne in mind by persons contemplating the use of Telephones.

The "D'Unger" is the only self-cleaning telephone in the world. It sends speech one (1) mile or five thousand (5,000) miles in a perfectly clear manner; can be operated at half the ordinary expense; is always in order, and has for its Receiver a Patent Compound Magneto, making but **one magnetic field.** It has likewise Paul D'Unger's Patent Diaphragm Regulator which prevents the words from running together. As a whole it is complete, cannot be surpassed, and has no equal. Pronounced by all unprejudiced electricians to be the **Peer of Telephones.** Address

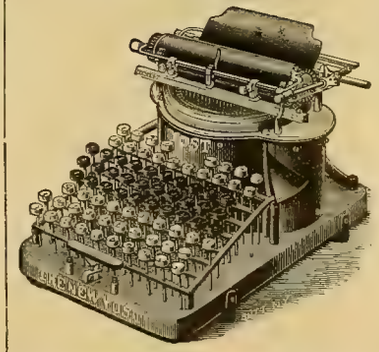
D'Unger Long-Distance Telephone Co.,
Palmer House, CHICAGO, ILL.

No D'Unger Telephones can be had for exchanges except through me. R. D'UNGER.



$5 to $15 per day, at home, selling **LIGHTNING PLATER** and plating jewelry, watches tableware, &c. Plates the finest of jewelry good as new, on all kinds of metal with gold, silver or nickel. No experience. No capital. Every house has goods needing plating. Wholesale to agents $5. Write for circulars. **H. E. DELNO & Co., Columbus, O.**

The New Yost 1894 Model.



Constructed on principles radically its own, insuring results always sought for but absolutely unattainable in the construction of any other machine. It is pre-eminently the telegrapher's and professional stenographer's typewriter.

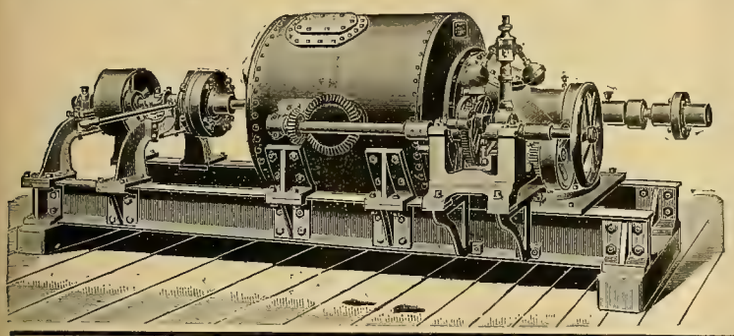
VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high speed and great Efficiency,** and **Large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent. of useful effect **guaranteed.** **SEND FOR CATALOGUE AND PARTICULARS.**

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of of 12-inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

CONTENTS.

PART I.—Polyphase Currents.

CHAPTER 1....Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors.—Synchronizing Motors.—Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31...."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

PART III.—Miscellaneous Inventions and Writings.

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by

YOU NEED THESE BOOKS.

NEW
DYNAMO TENDERS' HAND-BOOK.

By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. 138 Engravings.

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.

By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.

By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.

By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS.
"TRAMS."

Their Construction, Operation and Maintenance.

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. Profusely Illustrated.

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.

By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY
... OF ...
ELECTRICAL WORDS,
TERMS AND PHRASES.

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. 750 Illustrations.

PRICE, $5.00.

THE ELECTRIC MOTOR
AND ITS APPLICATIONS.

By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT
OF
DYNAMOS AND MOTORS.

By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS
FOR THE USE OF
Engineers and Architects.

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY
IN
THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. Profusely Illustrated.

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.

Experiments with Alternate Currents.

By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

We manufacture Complete Installations of

ELECTRICAL APPARATUS

For **CENTRAL STATION ELECTRIC LIGHTING,**
LONG DISTANCE TRANSMISSION OF POWER,
ELECTRIC RAILWAY AND ISOLATED PLANTS.

BRANCH OFFICES IN ALL LARGE CITIES.

ELECTRICITY FOR ENGINEERS.

Part I, 268 Pages, $2.00. Part II, 156 Pages, $1.00.

WHEN ORDERED TOGETHER PRICE IS $2.50.

Both Works Profusely Illustrated.

☛ **Just the Work for Engineers, Electricians, Dynamo Tenders, etc.**

PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current—How Produced — Induction — Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting— Testing— Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel— Multiple Series — Multiple Series Cut-Out — Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators — Brushes — Different Styles of Brushes — Double Brushes—Single Brushes—Troubles with Commutators and Brushes — Correct Position of Brushes — Sparking at Brushes — Care of Brushes and Commutators — Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation — Dynamo — Extra Brush — Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from Those Used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation — Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

Orders Promptly Filled on Receipt of Price. POSTAGE PREPAID.

JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage**, and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

THE JAMES LEFFEL & CO. SPRINGFIELD, OHIO, AND NEW YORK CITY.

A PACKARD MOGUL INCANDESCENT LAMP

Gives, by actual measurement, more light than
AN ALTERNATING CURRENT ARC LAMP
Using the same amount of energy.

Thus, a 200 candle power Mogul, consuming the same energy as would an ordinary alternating current arc will give a better and far more satisfactory illumination, requires no special resistance, converters or wiring, is much cheaper to install, has no disagreeable smell, noise or flicker and costs less to operate. All this we *guarantee.*

No. 61,235.

No. 61,565.

No. 61,465.

These Cut-Outs, for use on both two and three-wire systems, are constructed of the best hard, white, vitrified, non-absorbent Porcelain, which is made at our special porcelain factory at our Schenectady Works. This porcelain is of the highest insulation obtainable, and is the accepted standard throughout this country.

These Cut-Outs have been carefully designed to meet the strictest requirements of the fire underwriters, and with a view to obtain the maximum of reliability with the minimum of space and trouble. The LINK CUT-OUT is provided with a cover of mica. In the PLUG CUT-OUT the fuse is contained in a small brass cased plug screwed into the cut-out. Should the fuse blow, a new plug can be immediately inserted without the use of any tools.

The wire clamping device in these Cut-Outs is new and the best yet invented.

ANNOUNCEMENT.

CHICAGO. THE SIMPLEX ELECTRICAL Co. BOSTON.

We beg to announce that the relations heretofore existing, by which Mr. George Cutter has been acting as our Western Selling Agent, have been dissolved.

Our Chicago Office will hereafter be located at 1137 and 1138 Monadnock Block, and Mr. H. R. Hixson, who has for some time been identified with our interests in Chicago, will be in charge. A stock of Simplex Wire will be kept on hand, from which prompt shipments can be made.

We desire to express our appreciation of the favor with which the trade has received our goods, and hope for a continuance of these pleasant relations under the new arrangement.

Tel. Harrison 305. Western Selling Agent, **H. R. HIXSON, 1137 and 1138 Monadnock, CHICAGO.**

OKONITE TRADE MARK

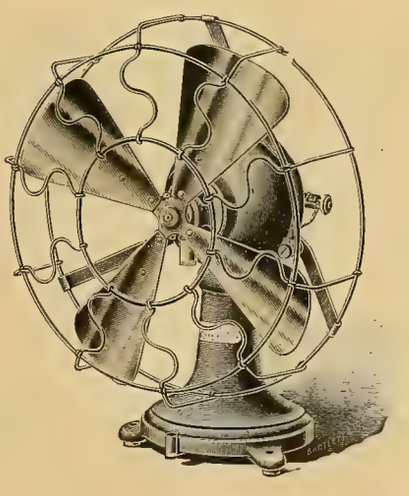
OKONITE TRADE MARK

OKONITE TRADE MARK

Now you take

Any wire in the market and compare it with **Okonite**—we don't mean just the superficial fingering of a few sample inches—dig into the stuff, get out your barlow and whittle off some slivers of insulation (it will be tough work), see how it looks **inside.** It is said that beauty is only skin deep but it is different with insulations, at least, with Okonite; insulation in this case strikes deep, it goes clean to the bone. The plain facts are that no other wires can favorably compare with Okonite. No matter where you put it nor how severe the service, Okonite will do all that you expect or want it to do. It has never betrayed a confidence.

We are the General Western Agents and carry a heavy line of all sizes for every purpose. Orders promptly filled.



It really seems that the festive weather clerks have quit their juggling and settled down to a rational schedule of temperature.

Now it's going to be **hot** (no mental reservations) and if you haven't already placed that order for **Lundell Fan Motors**—do it to-day. The day-after-tomorrow your customer can be luxuriating in the comforting breeze, the first of July you send in your bill.

To-day send us the order.

The Central Electric Company.

Don't make a Alternating Arc investigating

By Buying any Lamp before the

MON-ARC

Everything about it is of the very best. Brass Frame, Brass Shell, Brass Cap, Brass Rods. No tin or stovepipe iron. It combines unequaled simplicity with absence of all objectionable features heretofore present in alternating lamps. It is a **NON-STICKER** that central station men and lamp trimmers will be **STUCK** on because they don't have to **MONKEY** with it every few days, taking it down to clean and oil. Lamps for all systems. We guarantee every lamp. Write for prices.

Conneaut, O., Feby. 6th, 1894.

Helios Electric Co.,

Philadelphia, Pa.

Gentlemen:-

We are in receipt of your inquiry regarding your Alternating Arc Lamps; would say, they are just simply perfection. We now have 14 in use and work to our entire satisfaction in every respect; the light is absolutely steady and the only arc Lamp that I ever saw that gives a perfect steady light. It has been said that there could not be an arc lamp made to work on the Alternating current and do good work, but you have struck it, and I have got to hear the first word spoken against it, and in my opinion the Direct Current Lamp has seen its day.

Yours respectfully,

W. H. Webb Supt.,

Conneaut Electric Light Co.

W. U. Double Petticoat Teat Insulator.

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. This device can be applied to any insulator.

Standard Screw Glass Insulators, Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems. Colored Glass Insulators to designate different currents.

WORK ON SPECIAL DESIGNS A FEATURE.

THE

"CLARK" WIRE.

TRADE MARK.

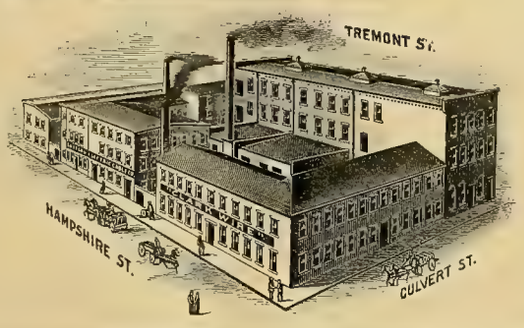
For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,

GREAT WESTERN MFG. CO.,

Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

Special low rates on Friday and Saturday of each week for tickets good to return until Monday. For further information apply at Ticket Office, 207 Clark St., or Union Passenger Station, Canal, Adams and Madison Sts.

THE WONDERFUL

D'Unger Telephone.

Highly Important to Telephone Users.

BEWARE OF INFRINGING!

The D'Unger Long Distance Telephone (the "Far-Away Talker") can now be had for use in Telephone Exchanges on a small annual royalty, and **on no other terms**. It is constructed under numerous patents, especially **Patent No. 390,575**, granted Oct. 2, 1888, which is not only the **first**, but **the only undisputed and indisputable valid patent granted for an All-Carbon Multiple-Contact Microphonic Telephone Transmitter.** All all-carbon multiple-contact telephone transmitters built without or under patents granted since Oct. 2, 1888, are **infringements upon Patent No. 390,575**—a fact to be borne in mind by persons contemplating the use of Telephones.

The "D'Unger" is the only self-cleaning telephone in the world. It sends speech one (1) mile or five thousand (5,000) miles in a perfectly clear manner; can be operated at half the ordinary expense; is always in order, and has for its Receiver a Patent Compound Magneto, making but **one magnetic field**. It has likewise Paul D'Unger's Patent Diaphragm Regulator, which prevents the words from running together. As a whole it is complete, cannot be surpassed, and has no equal. Pronounced by all unprejudiced electricians to be the **Peer of Telephones.** Address

D'Unger Long-Distance Telephone Co.,
Palmer House, CHICAGO, ILL.

No D'Unger Telephones can be had for exchanges, except through me. R. D'UNGER.

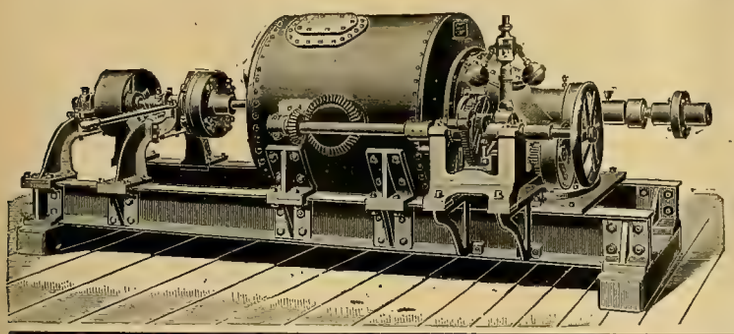
VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high speed and great Efficiency**, and **Large Capacity** for its **diameter**, being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent. of useful effect **guaranteed.** **SEND FOR CATALOGUE AND PARTICULARS.**

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of of 12-inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current—How Produced—Induction—Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps—Filaments—Connections—Flashing—Exhausting—Testing—Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel—Multiple Series—Multiple Series Cut-Out—Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators—Brushes—Different Styles of Brushes—Double Brushes—Single Brushes—Troubles with Commutators and Brushes—Correct Position of Brushes—Sparking at Brushes—Care of Brushes and Commutators—Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation—Dynamo—Extra Brush—Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from Those Used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation—Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

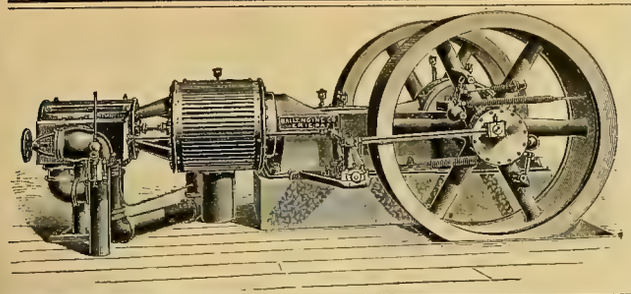
CHAPTER XIX.

Ground Alarms and Leak Detectors.

Orders Promptly Filled on Receipt of Price. Postage Prepaid.

ELECTRICIAN PUBLISHING CO.,

6 LAKESIDE BUILDING, CHICAGO.



BALL ENGINE CO.,

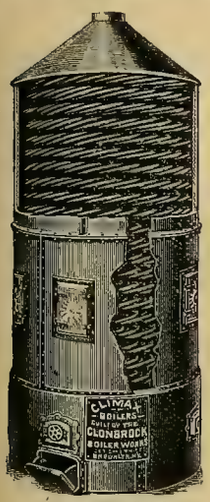
ERIE, PA.

Improved Heavy Duty Engines for Electric Lighting and Railways.

DIRECT CONNECTED and BELT DRIVEN.

J. W. PARKER & CO., General Agents, 30 Cortlandt Street, NEW YORK CITY.

CHICAGO OFFICE: 506 "The Rookery."



The "CLIMAX" STEAM BOILER

Three Boilers Sold Chicago Edison Co.

The Only Boiler Tested at the World's Columbian Exposition.

The only NON-EXPLOSIVE boiler made.
Will save you money on coal.
Built in units from 50 to 1500 H. P.

MANUFACTURED BY

Clonbrock Steam Boiler Works,

Grinnell and Court Sts., BROOKLYN, N. Y.

Send for new Catalogue.

ANNOUNCEMENT.

The entire stock of drawings, patterns, finished and unfinished engines of the **Giddings Automatic** type have been purchased of the Sioux City Engine Works by **THE BROWNELL & COMPANY** of Dayton, Ohio, who have secured the exclusive right to manufacture under these patents and have engaged the services of **Mr. C. M. Giddings, M. E.**, who is the original designer and patentee of this engine, as Superintendent of their Engineering Department, and who will turn out strictly **High Grade** work for **Electric Light and Railway Purposes.** Having one of the largest boiler manufactories in the country, they are prepared to equip and install complete power plants ready for operation at prices which will defy competition.

Watch this Space for Change each Issue.

DELAWARE HARD FIBRE COMPANY.

THE BEST ORIGINAL SUBSTITUTE FOR HARD RUBBER.

Adopted by the leading Electric Companies of the United States and Europe.

A More Satisfactory Insulator at Half the Cost.

Send for Our Illustrated Catalogue.

FACTORY, Wilmington, Del., Store, 15 Long Lane, LONDON.

CHICAGO AGENT, J. L. Thompson, 107 Dearborn Street.

A PACKARD MOGUL INCANDESCENT LAMP

Gives, by actual measurement, more light than

AN ALTERNATING CURRENT ARC LAMP

Using the same amount of energy.

Thus, a 200 candle power Mogul, consuming the same energy as would an ordinary alternating current arc will give a better and far more satisfactory illumination, requires no special resistance, converters or wiring, is much cheaper to install, has no disagreeable smell, noise or flicker and costs less to operate. All this we *guarantee*.

NEW YORK & OHIO CO., WARREN, OHIO.
Makers of PACKARD LAMPS, 5 to 500 Candle Power.

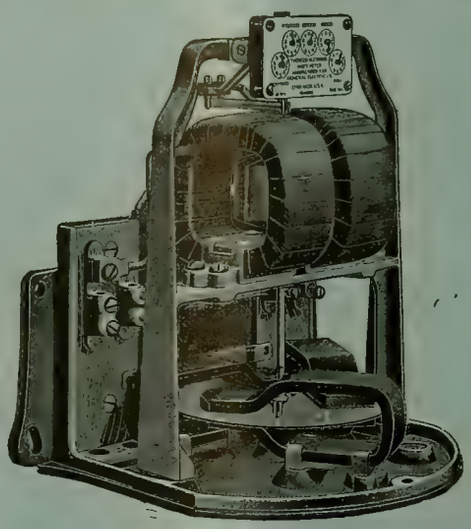
THE NEW INCANDESCENT ARC LIGHT.

THE ROYAL ARC ELECTRIC CO., U. S. A., 143 Liberty St., New York.

RECORDING WATT-METER.

ACCURATE UNDER ALL VARIATIONS OF PRESSURE.



NOT AFFECTED BY FREQUENCY OF ALTERNATIONS.

For Direct or Alternating Lighting Circuits, Or Arc Light, Railway or Stationary Motor Circuits.

THE IDEAL METER.

DIRECT READING.

Accurate on One Lamp. Accurate on Full Load. Slow Speed and Long Life. ENERGY Consumed in Operation so SMALL as to be PRACTICALLY NEGLIGIBLE. Applicable to Station Switchboards. Measuring Entire Output, Primary, Three Wire or Railway.

The Only Meter constructed to satisfy the requirements of Electrical Plants of every description.

NEW TYPES.

- ARC CIRCUIT METERS for measurement of station output.
- ARC CIRCUIT METERS for commercial use, 4 and 8 light.
- PORTABLE METERS FOR TESTING STREET CARS, accurate under severe jar.
- Large Meters for Measurement of Station Output in sizes up to 8,000 amperes, invaluable for Railway Work.

This Meter was first placed on the market in 1889. To-day over 52,000 are now in use.

CARPENTER ENAMEL RHEOSTATS.

ANNOUNCEMENT.

CHICAGO, THE SIMPLEX ELECTRICAL Co. BOSTON,

1137-1138 Monadnock. 75-81 Cornhill Street.

We beg to announce that the relations heretofore existing, by which Mr. George Cutter has been acting as our Western Selling Agent, have been dissolved.

Our Chicago Office will hereafter be located at 1137 and 1138 Monadnock Block, and Mr. H. R. Hixson, who has for some time been identified with our interests in Chicago, will be in charge. A stock of Simplex Wire will be kept on hand, from which prompt shipments can be made.

We desire to express our appreciation of the favor with which the trade has received our goods, and hope for a continuance of these pleasant relations under the new arrangement.

THE SIMPLEX ELECTRICAL CO.

Western Selling Agent, H. R. HIXSON, 1137 and 1138 Monadnock, CHICAGO. **Tel. Harrison 305.**

The Harrison International Telephone Co.

AGENTS' TERRITORIES NOW BEING ALLOTTED. WRITE AT ONCE.

WHAT MONEY CAN EARN AND THE PEOPLE SAVE BY MEANS OF THE

Harrison International Telephone.

We either sell our telephones outright or lease them for a term of years.

This company owns Letters Patent No. 476,200, granted to E. M. Harrison May 30, 1892, and Letters Patent No. 499,108, granted to E. M. Harrison June 6, 1890, for a complete electric speaking telephone operated by battery; and owns Letters Patent No. 435,295, granted to William Hutson Ford August 26, 1890, for an automatic switchboard. Our patents embrace every device necessary in the construction of a telephone plant with either manual or automatic switchboard.

Prospectuses furnished by addressing the Company at their offices,

44 and 46 Wall St., New York.

ELECTRIC LIGHT and RAILWAY PIPE POLES A SPECIALTY.

Okonite Wire

No other insulated wire enjoys such universal popularity, or deserved honor. **Okonite** occupies much the same unique and distinctive position in the Electrical field that the Kodak does in the realm of photography. **"Okonite"** has become a general term for all that is desirable and acceptable in wire insulation.

Interior Conduits

Electrical Engineers often wonder how they ever got along before the days of "Conduit." How they had the temerity to call a job complete or safe without it and with cheerful assurance collect their bill.

No doubt Insurance men are of the same opinion. **Interior Conduit** has done more to rescue electrical wiring from a gathering distrust and contempt than any other device or appliance yet invented.

Lundell Fan Motors

Have created a veritable cyclone of enthusiasm. No specialty that we have had the pleasure of "pushing" has rewarded our efforts in any greater degree. They are so evidently superior, and altogether pleasing in looks and performance, that it requires but little "personal" magnetism to effect a sale.

Besides

Being the General Western Agents for the above seasonable specialties, we manufacture, import, and deal in the best grades of Electrical merchandise of every description.

The largest and best appointed Electrical Supply House in the World.

The Central Electric Company,

173-175 Adams Street,

CHICAGO.

Don't make a Alternating Arc investigating

By Buying any Lamp before the

MON-ARC

Everything about it is of the very best. Brass Frame, Brass Shell, Brass Cap, Brass Rods. No tin or stovepipe iron. It combines unequaled simplicity with absence of all objectionable features heretofore present in alternating lamps. It is a **NON-STICKER** that central station men and lamp trimmers will be **STUCK** on because they don't have to **MONKEY** with it every few days, taking it down to clean and oil. Lamps for all systems. We guarantee every lamp. Write for prices.

For Street Lighting.

OFFICE OF

Conneaut Electric Lighting Co.

T. S. WINSHIP, PRESIDENT.
C. HAYWARD, SECRETARY.
A. O. HOSKINS, TREASURER.
W. H. WEBB, SUPERINTENDENT

Conneaut, O., Feby. 6th, 1894.

Helios Electric Co.,

Philadelphia, Pa.

Gentlemen:-

We are in receipt of your inquiry regarding your Alternating Arc Lamps; would say, they are just simply perfection. We now have 14 in use and work to our entire satisfaction in every respect; the light is absolutely steady and the only arc Lamp that I ever saw that gives a perfect steady light. It has been said that there could not be an arc lamp made to work on the Alternating current and do good work, but you have struck it, and I have got to hear the first word spoken against it, and in my opinion the Direct Current Lamp has seen its day.

Yours respectfully,

W. H. Webb Supt.

W. U. Double Petticoat Teat Insulator.

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

Standard Screw Glass Insulators, Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems, Colored Glass Insulators to designate different currents.

WORK ON SPECIAL DESIGNS A FEATURE.

THE

"CLARK" WIRE.

TRADE MARK.

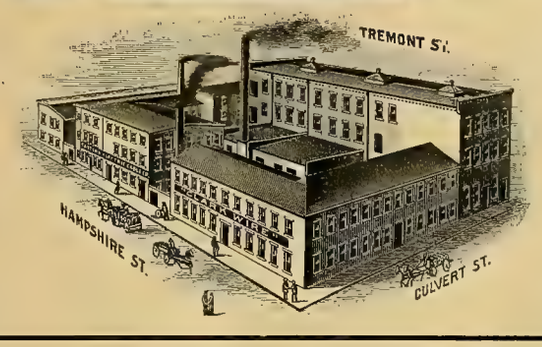
For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,

GREAT WESTERN MFG. CO.,

Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

Analysis of Sal Ammoniac.

J. B. WEIS,
Analytical and Consulting Chemist
AND ASSAYER,
Room 42, 81 Clark Street.

☞Prices on application.

Certificate of Analysis, No. 918. Chicago, March 9, 1894.

This Certifies that I have analyzed sample of Sal Ammoniac, marked "A. G. Sal Ammoniac," submitted by Western Electric Company.

I find the amount of:

Ammonium Chloride	contained	therein	to be	99.51	per cent.
Ammonium Sulphate	"	"	"	0.03	"
Moisture	"	"	"	0.13	"
Non-Volatile Matter	"	"	"	0.02	"
Organic Matter	"	"	"	0.31	"

The Non-Volatile Matter consists of Iron Oxide and Alumina.

Signed, J. B. WEIS.

THE WONDERFUL

D'Unger Telephone.

Highly Important to Telephone Users.

BEWARE OF INFRINGING!

The D'Unger Long Distance Telephone (the "Far-Away Talker") can now be had for use in Telephone Exchanges on a small annual royalty, and **on no other terms**. It is constructed under numerous patents, especially **Patent No. 390,575**, granted Oct. 2, 1888, which is not only the **first**, but **the only undisputed and indisputable valid patent granted for an All-Carbon Multiple-Contact Microphonic Telephone Transmitter.** All all-carbon multiple-contact telephone transmitters built without or under patents granted since Oct. 2, 1888, are **infringements upon Patent No. 390,575**—a fact to be borne in mind by persons contemplating the use of Telephones.

The "D'Unger" is the only self-cleaning telephone in the world. It sends speech one (1) mile or five thousand (5,000) miles in a perfectly clear manner; can be operated at half the ordinary expense; is always in order, and has for its Receiver a Patent Compound Magneto, making but **one magnetic field**. It has likewise Paul D'Unger's Patent Diaphragm Regulator, which prevents the words from running together. As a whole it is complete, cannot be surpassed, and has no equal. Pronounced by all unprejudiced electricians to be the **Peer of Telephones.** Address

D'Unger Long-Distance Telephone Co.,
Palmer House, CHICAGO, ILL.

No D'Unger Telephones can be had for exchanges, except through me. R. D'UNGER.

IMPERIAL DRY BATTERY.

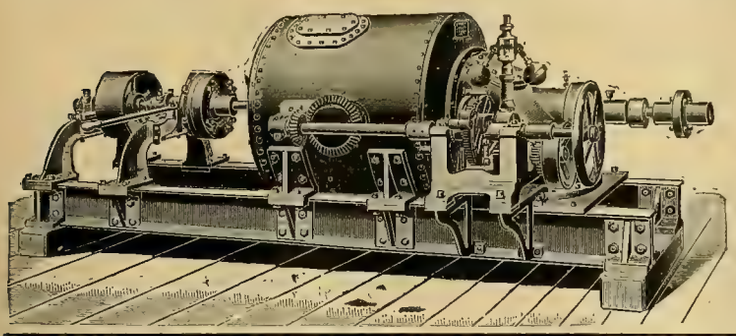
Guaranteed the best Dry Battery ever made. Internal short circuiting or local action is eliminated. Will not deteriorate when not doing work. Will hold its first value over long periods of time. Internal resistance small; high and constant, E. M. F. Will not run down or die on the shelf. No bursting of seals or oozing of salts from the top.

Burnley Cartridge Battery.

Cartridge or Porous Cups made of especially prepared paper. One-half the size and one-third the weight of other porous cups. Guaranteed to be equal to any Salammoniac battery made. The cheapest battery now on the market.

All Batteries Guaranteed. **Send for Catalogue.**

VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high speed and great Efficiency,** and **Large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent. of useful effect **guaranteed.** **SEND FOR CATALOGUE AND PARTICULARS.**

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of of 12-inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

STILWELL & BIERCE MFG. CO., - Dayton, Ohio.

"If circumstances lead I will find where truth is hid, though it were hid indeed within the center."

Thus spoke our friend Polonius to Claudius and then he started out on his journey .....

followed this road.....

.....arrived here in due season and stopped.

The other day, incidentally meeting us in the street, he threw his arms around us and exclaimed: "The friends thou hast and their adoption tried, grapple them to thy soul with hoops of steel."

MORAL: If you have, like Polonius had, a sea of trouble with the Cells you are using, hunt us up, and if the satisfaction that you will experience in handling the celebrated **"LAW DOUBLE CYLINDER"** cell is not such as will make you our friend, we are indeed lacking in our knowledge of human nature. Its great forte is its Holding-up Power and combined with an Uniformity of Current from first to last, thereby giving you a Cell, altho' a little dearer at the start than some other Cells, eventually the cheapest on the market.

INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

CONTENTS.

PART I.—Polyphase Currents.

CHAPTER 1....Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors.—Synchronizing Motors.—Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31....."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

PART III.—Miscellaneous Inventions and Writings.

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by

TESLA'S NEW BOOK?

"IDEAL" INSULATED COPPER WIRE.

Best Substitute for Rubber.

HIGH INSULATION. LONG LIFE. LOW COST.

— MANUFACTURED BY —

PHILLIPS INSULATED WIRE CO.

NEW YORK OFFICE: 39-41 Cortlandt Street. **FACTORY: PAWTUCKET, R. I.**

AGENCIES:

Electric Appliance Co., CHICAGO. Partrick & Carter Co., PHILADELPHIA. Electrical Engineering Co., MINNEAPOLIS.

WESTINGHOUSE ELECTRIC & MANUFACTURING CO.,

PITTSBURGH, PA.

We manufacture Complete Installations of

ELECTRICAL APPARATUS

For **CENTRAL STATION ELECTRIC LIGHTING,**
LONG DISTANCE TRANSMISSION OF POWER,
ELECTRIC RAILWAY AND ISOLATED PLANTS.

BRANCH OFFICES IN ALL LARGE CITIES.

YOU NEED THESE BOOKS.

NEW DYNAMO TENDERS' HAND-BOOK.

By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. 138 Engravings.

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.

By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.

By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.

By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS.

"TRAMS."

Their Construction, Operation and Maintenance.

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. Profusely Illustrated.

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.

By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY ... OF ... ELECTRICAL WORDS,

TERMS AND PHRASES.

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. 750 Illustrations.

PRICE, $5.00.

THE ELECTRIC MOTOR AND ITS APPLICATIONS.

By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT OF DYNAMOS AND MOTORS.

By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS FOR THE USE OF Engineers and Architects.

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. Profusely Illustrated.

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.

Experiments with Alternate Currents.

By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

SEND IN YOUR ORDER.

JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage,** and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

THE JAMES LEFFEL & CO. SPRINGFIELD, OHIO, AND NEW YORK CITY.

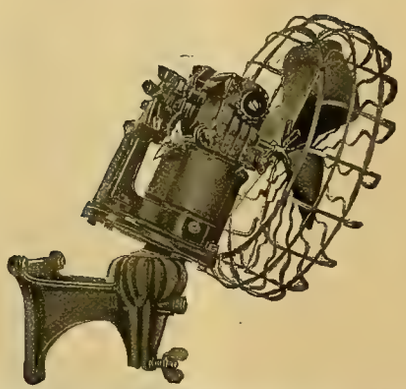
Kester Arc Lamp.

Vulcanized Sheet, Rod and Tubing.

Xntric Switches.

Kester Commutator Compound.

Knox Circuit Breaker.



Crocker-Wheeler Bracket Fan Motor.

Our bracket fan, which is undoubtedly the greatest novelty in the Fan Motor line this year, is arranged so that the motor may be thrown in any position. This convenient arrangement has been secured by mounting the motor on a bracket fitted with a ball and socket joint. The bracket is arranged to be screwed on the wall and then by simply turning a thumb-screw the motor can be adjusted to any desired angle, and a breeze thrown to any part of the room.

We carry a large stock of these fans on hand, but so that your orders may be promptly filled, we would suggest that you place them early and not wait until the hot weather when there might be some slight delay.

N. I. R. Wires, Cables, Tape and Lamp Cord.

"Metropolitan" Incandescent Lamp.

I. X. L. Triple Braid Weatherproof Wire.

Crocker-Wheeler Fan Motors.

Dayton Electric Ceiling Fans.

A PACKARD MOGUL INCANDESCENT LAMP

Gives, by actual measurement, more light than
AN ALTERNATING CURRENT ARC LAMP
Using the same amount of energy.

Thus, a 200 candle power Mogul, consuming the same energy as would an ordinary alternating current arc will give a better and far more satisfactory illumination, requires no special resistance, converters or wiring, is much cheaper to install, has no disagreeable smell, noise or flicker and costs less to operate. All this we *guarantee.*

NEW YORK & OHIO CO., WARREN, OHIO.

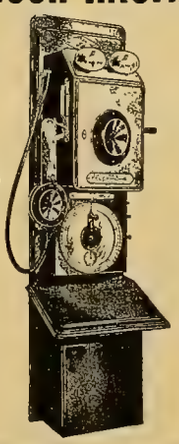
WRITE AT ONCE.



WHAT MONEY CAN EARN AND THE PEOPLE SAVE BY MEANS OF THE

Harrison International Telephone.

We either sell our telephones outright or lease them for a term of years.

This company owns Letters Patent No. 476,200, granted to E. M. Harrison May 30, 1892, and Letters Patent No. 499,108, granted to E. M. Harrison June 6, 1890, for a complete electric speaking telephone operated by battery; and owns Letters Patent No. 435,295, granted to William Hutson Ford August 26, 1890, for an automatic switchboard. Our patents embrace every device necessary in the construction of a telephone plant with either manual or automatic switchboard.

ELECTRIC LIGHT and RAILWAY PIPE POLES A SPECIALTY.

Important! Send your orders *to-day;* don't get fenced out by the Pullman boycott. If there are no trains we can't ship. A motor won't go by telegram, not if the telegram knows it.

"We told you so"

and if it's any comfort you can go over in a corner and flock all by yourself while you contemplate the situation.

It did get mighty hot, all of a sudden, didn't it? And wouldn't it have been nice to have had a long shelf full of assorted sizes Fan Motors? Lundell's?

Well, to tell the honest truth we never had such a rush of orders—telegrams, special delivery letters, and just plain orders to "ship by next express;" we wish some of *our* shelves had been longer, for it just about cleaned us out of some sizes, but we were expecting it, had a lot on the road and now we're fixed for another rush.

Remember! We are the General Western Agents for the Lundell Fan Motors. You can't find a better motor, nor a place to get them quicker than our store.

This is the man who didn't have any Fan Motors on hand.

"WANTED—A small but stout lad, one who has had experience operating a Bogardus kicker. Apply on the premises."

Referring again to the question of an insulated wire, it seems to us that you can't find a better one than Okonite. Size it up any way you want to, use it for any purpose under the sun, put it anywhere you please and it does the work. *It never disappoints.*

For all electrical work we have every kind of construction tool that you will possibly need—the very best.

Knoxville Electric Light and Power Co.

Knoxville, Ill., Feb 5 1894

Helios Electric Co
Philadelphia Pa

Gentlemen,- Your inquiry in regard to the Helios arc lamps received, and in reply would say that we are using 26 of your lamps for street lighting purposes and they are giving very good satisfaction. The lamps we are using are your regular half arc lamps. There was a test made a few days ago by an expert, and he gave his opinion that the lamps were giving the rated candle power. We would recomend them to any one desiring to use a street lighting system and especially where coal is dear. it would be much more economical to use the Helios lamps from the incandescent machine than to use a separate arc machine.

Yours Truly
Knoxville Elec Lt & P Co.

W. U. Double Petticoat Teat Insulator.

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

Standard Screw Glass Insulators, Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems. Colored Glass Insulators to designate different currents.

WORK ON SPECIAL DESIGNS A FEATURE.
Send Model or Drawing and we will furnish estimates.

HEMINGRAY GLASS CO.,

THE

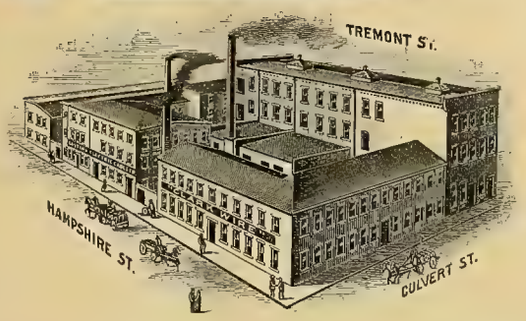
"CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

J. B. Carney, on premises, or at 6 Lakeside Building.

THE WONDERFUL

D'Unger Telephone.

Highly Important to Telephone Users.

BEWARE OF INFRINGING!

The D'Unger Long Distance Telephone (the "Far-Away Talker") can now be had for use in Telephone Exchanges on a small annual royalty, and **on no other terms**. It is constructed under numerous patents, especially **Patent No. 390,575**, granted Oct. 2, 1888, which is not only the **first**, but **the only undisputed and indisputable valid patent granted for an All-Carbon Multiple-Contact Microphonic Telephone Transmitter.** All all-carbon multiple-contact telephone transmitters built without or under patents granted since Oct. 2, 1888, are **infringements upon Patent No. 390,575**—a fact to be borne in mind by persons contemplating the use of Telephones.

The "D'Unger" is the only self-cleaning telephone in the world. It sends speech one (1) mile or five thousand (5,000) miles in a perfectly clear manner; can be operated at half the ordinary expense; is always in order, and has for its Receiver a Patent Compound Magneto, making but **one magnetic field**. It has likewise Paul D'Unger's Patent Diaphragm Regulator, which prevents the words from running together. As a whole it is complete, cannot be surpassed, and has no equal. Pronounced by all unprejudiced electricians to be the **Peer of Telephones.** Address

D'Unger Long-Distance Telephone Co.,
Palmer House, CHICAGO, ILL.

No D'Unger Telephones can be had for exchanges, except through me. R. D'UNGER.

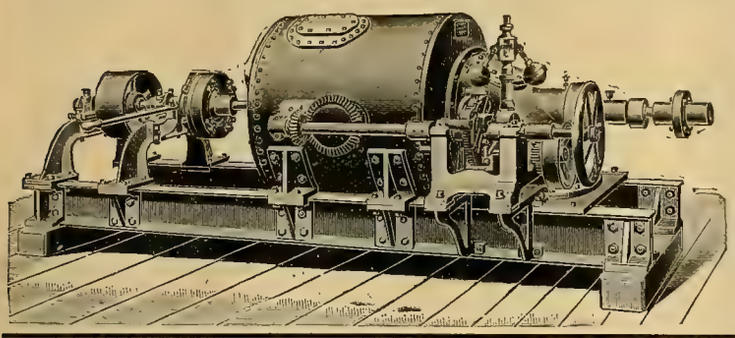
VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high speed and great Efficiency,** and **Large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent. of useful effect **guaranteed.** **SEND FOR CATALOGUE AND PARTICULARS.**

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of of 12-inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

STILWELL & BIERCE MFG. CO., - Dayton, Ohio.

"If circumstances lead I will find where truth is hid, though it were hid indeed within the center,"

Thus spoke our friend Polonius to Claudius and then he started out on his journey .....

.....followed this road.....

.....arrived here in due season and stopped.

The other day, incidentally meeting us in the street, he threw his arms around us and exclaimed: "The friends thou hast and their adoption tried, grapple them to thy soul with hoops of steel."

MORAL: If you have, like Polonius had, a sea of trouble with the Cells you are using, hunt us up, and if the satisfaction that you will experience in handling the celebrated **"LAW DOUBLE CYLINDER"** cell is not such as will make you our friend, we are indeed lacking in our knowledge of human nature. Its great forte is its Holding-up Power and combined with an Uniformity of Current from first to last, thereby giving you a Cell, altho' a little dearer at the start than some other Cells, eventually the cheapest on the market.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded—Fuses—Regulation—Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from Those Used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation—Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

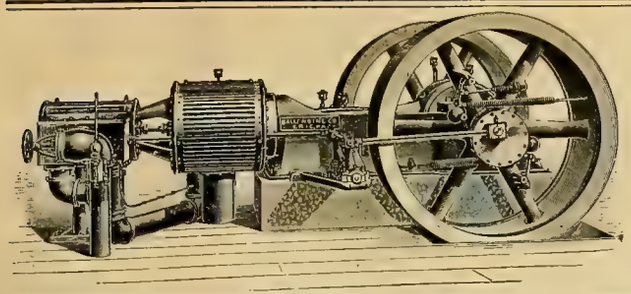
CHAPTER XIX.

Ground Alarms and Leak Detectors.

Orders Promptly Filled on Receipt of Price. Postage Prepaid.

ELECTRICIAN PUBLISHING CO.,

6 LAKESIDE BUILDING, CHICAGO.



BALL ENGINE CO.,

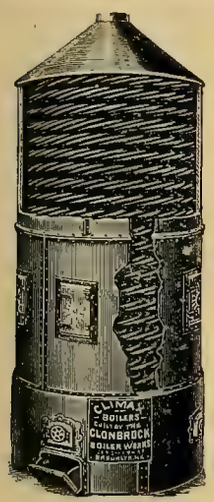
ERIE, PA.

Improved Heavy Duty Engines for Electric Lighting and Railways.

DIRECT CONNECTED and BELT DRIVEN.

J. W. PARKER & CO., General Agents,
30 Cortlandt Street, NEW YORK CITY.

CHICAGO OFFICE:
506 "The Rookery."



The "CLIMAX" STEAM BOILER

Three Boilers Sold Chicago Edison Co.

The Only Boiler Tested at the World's Columbian Exposition.

The only NON-EXPLOSIVE boiler made.
Will save you money on coal.
Built in units from 50 to 1500 H. P.

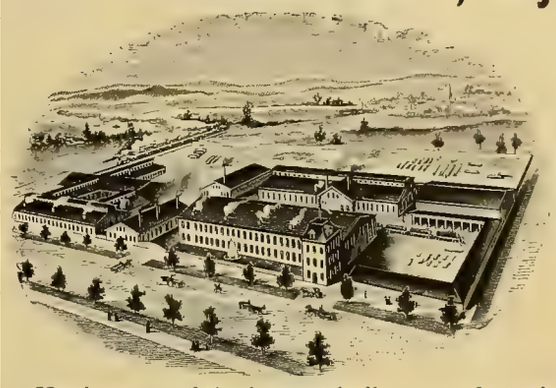
MANUFACTURED BY

Clonbrock Steam Boiler Works,

Grinnell and Court Sts., BROOKLYN, N. Y.

Send for new Catalogue.

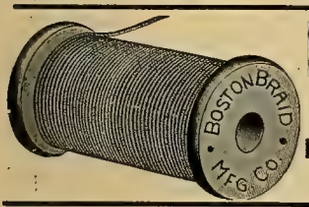
THE BROWNELL & CO., Dayton, Ohio,



Manufacturers of

AUTOMATIC, THROTTLING ENGINES, BOILERS, STANDPIPES, TANKS and GENERAL SHEET IRON WORK.

Having one of the largest boiler manufactories in the country, equipped with the latest and most approved machinery, we are prepared to equip Complete Steam Plants ready for operation.



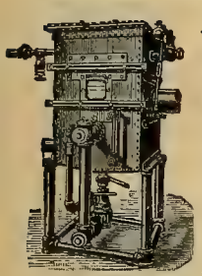
SILK BRAID

For Incandescent Lamp Filaments.

The greatest care taken in producing a uniform article.

BOSTON BRAID MFG. CO.,

27 Beach Street, Boston, Mass.



Successful Manufacturers *are wont to investigate fully before adopting any mechanical appliances, and it is to such that we sell our Vacuum Feed Water Heater and Purifier, the Webster Separator,* and *Williames Vacuum System of Steam Heating.*

We will be pleased to send you Catalogues of these.

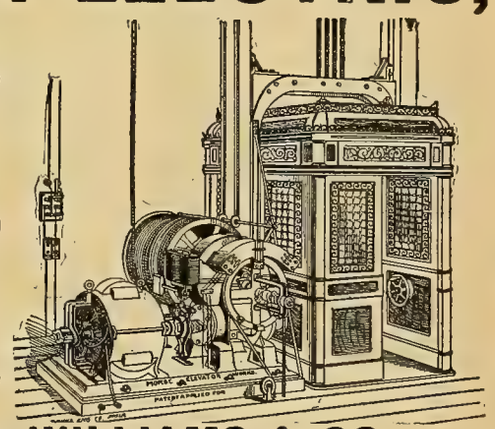
Warren Webster & Co.,

No. 5. Camden, N. J.

NEW YORK—126 Liberty Street. CHICAGO—Monadnock Building.

DIRECT ELECTRIC,

The Latest Improved Type of Elevators.



HAVE YOU SEEN OURS?

It has many advantages over all others now in the market.

Kester Arc Lamp.

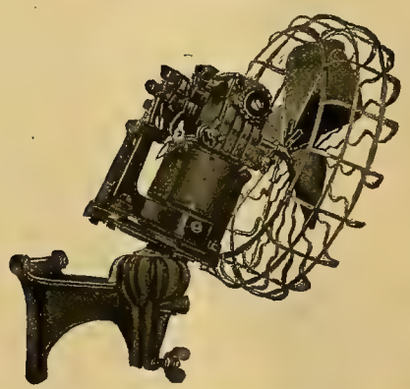
Vulcanized Sheet, Rod and Tubing.

Xntric Switches.

Kester Commutator Compound.

Knox Circuit Breaker.

Garton Lightning Arrester.



Crocker-Wheeler Bracket Fan Motor.

Our bracket fan, which is undoubtedly the greatest novelty in the Fan Motor line this year, is arranged so that the motor may be thrown in any position. This convenient arrangement has been secured by mounting the motor on a bracket fitted with a ball and socket joint. The bracket is arranged to be screwed on the wall and then by simply turning a thumb-screw the motor can be adjusted to any desired angle, and a breeze thrown to any part of the room.

We carry a large stock of these fans on hand, but so that your orders may be promptly filled, we would suggest that you place them early and not wait until the hot weather when there might be some slight delay.

We have Disk Fans also.

N. I. R. Wires, Cables, Tape and Lamp Cord.

"Metropolitan" Incandescent Lamp.

I. X. L. Triple Braid Weatherproof Wire.

Crocker-Wheeler Fan Motors.

Dayton Electric Ceiling Fans.

Chicago Spark Arrester
